Peyzaj Mimarlığı Bölümü bir dört yılını daha başarılarla tamamladı. Ekoloji ve teknoloji ekseninde doğa ve kültüre saygılı projelerin üretilmesi ve eğitimin verilmesini misyon edinen bölümümüz ülkemizdeki peyzaj mimarlığı alanındaki öncü rolünü korumaya devam etmektedir. Geçen dört yıl, disiplinler arası ilişkiler, ulusal ve uluslararası ölçekte akademik ve araştırma ağlarımızı geliştirmemizde önemli fırsatlar sunmaya devam etmekle birlikte pandeminin etkisi ile eğitimin ve iletişimin dünya genelinde aksadığı, yeni pedagojik modelleri keşfetmemizi zorunlu kılan zorlayıcı bir dönem bu dört yılı tariflemektedir. Gerek pandemi gerekse de her geçen gün olumsuz etkilerinin daha da hissedildiği iklim değişimi nedeniyle mesleğimizin eylem alanları olan açık ve yeşil alanların kent ekolojisi, toplum sağlığı, dayanıklı şehirler ve toplumlar oluşturmada vazgeçilmez bir rolünün olduğu dünya genelinde anlaşılmıştır. Sorumluluğunun bilincinde peyzaj mimarları yetiştirmek üzere yeniden şekillendirdiğimiz eğitimimizin içeriğine öğrencilerimizin ve mezunlarımızın gösterdiği ilgi beraberinde pek çok yayını, ödülü ve araştırmayı getirmiştir. Bu sebeple 2018-2022 dönemini bölümümüzün jeo-politik, iklimsel ve sosyo-ekolojik her tür krize rağmen üretken şekilde değerlendirmesi özveri ile çalışan öğretim görevlilerimiz ve Fakültemizdeki akademik kültürün öğretileri ile mümkün olmuştur. Emeği geçen herkese şükranlarımı sunarım.

BÖLÜM BAŞKANI'NDAN
FROM THE HEAD OF THE DEPARTMENT

The Department of Landscape Architecture has successfully completed another four years. Our department, which is dedicated to producing projects that respect nature and culture within the axes of ecology and technology and providing education, continues to maintain its pioneering role in the field of landscape architecture in our country. Over the past four years, despite the impact of the pandemic causing disruptions in education and communication worldwide, we have continued to present significant opportunities for developing interdisciplinary relationships and our academic and research networks on national and international scales. This period, which has forced us to explore new pedagogical models, is defining these four years. Due to the pandemic and the increasing negative effects of climate change, there is a global understanding of the indispensable role of our profession in creating open and green spaces for urban ecology, public health, and resilient cities and societies. The interest shown by our students and graduates in the content of our education, which we have reshaped to train landscape architects aware of their responsibilities, has brought along many publications, awards, and research. Despite geopolitical, climatic, and socio-ecological crises, we have productively evaluated the 2018-2022 period, thanks to the dedication of our faculty members and the academic culture in our faculty. I express my gratitude to everyone who contributed to this effort.

BÖLÜM HAKKINDA

ABOUT THE DEPARTMENT

İTÜ Peyzaj Mimarlığı Bölümü'nün Özgörevi

- . Doğal kaynakların korunması ve etkin şekilde kullanılması, sürdürülebilir bir yaşam ortaklığının gözetilmesini öncelikli bir sorun olarak ele alan,
- . Ulusal peyzaj mimarlığı mesleğinin uygulama normlarını ve koşullarını yeniden oluşturacak,
- . Araştırmacı, bilimsel ve eleştirel düşünmeyi benimsemiş, özgün düşünceler geliştirebilecek ve bunları uygulama becerisine sahip,
- . Diğer tasarım dalları ve disiplinlerle ortak araştırma ve üretim yapabilecek,
- . Ulusal ve uluslararası alanda lider olabilecek donanımda peyzaj mimarları yetiştirmektir.

İTÜ Peyzaj Mimarlığı Bölümü'nün Özgörüşü

- . Ulusal peyzaj mimarlığı eğitiminde öncü olmak ve ulusal akreditasyon kriterlerini belirlemek,
 - . Uluslararası alanda peyzaj mimarlığı araştırmaları, eğitimi ve bilgi üretiminde söz sahibi olmak,
 - . Diğer tasarım alanları ve disiplinlerle ortak üretim yapabilecek şekilde mesleki kuram, uygulama, yöntem ve süreçlerini geliştirmektir.
- İTÜ Peyzaj Mimarlığı eğitiminde peyzaj tasarımı kuramı ve uygulamaları, peyzaj planlama, doğa ve insan bilimleri, görsel iletişim, peyzaj mühendisliği, çevre yönetimi ve meslek pratiği konularında öğrencilerin bilgilendirilmeleri hedeflenmektedir. Ayrıca, araştırma, veri toplama, sentez yapma ve problem çözme becerilerinin tasarıma yansıtılmasını sağlayacak bilgiler ile tasarıma destek olacak serbest çizim, teknik çizim ve bilgisayar kullanım becerileri verilmektedir.

Our program is rooted in a studio-based teaching environment with a relatively low student-to-teacher ratio, enabling close mentor-to-peer interaction.

The department offers students an opportunity to focus on the relationship of natural and man-made environments ranging from community landscape design to regional environmental planning and protection. The program of study provides a strong foundation in the natural and social sciences. It includes training in both traditional skills and contemporary methods. With the continuing expansion of our cities and suburban areas, landscape architects increasingly serve not only as designers but also as advocates of landscape reclamation and conservation. Public values are stressed through courses in environmental law and community participation in planning and design, and through an overriding concern for the protection of the environment.

İstanbul Teknik Üniversitesi Mimarlık Fakültesi bünyesinde gerçekleştirilen Peyzaj Mimarlığı eğitimi toplam 4 yıl sürmektedir. İTÜ Mimarlık Fakültesi'nde ilk üç yarıyıl Peyzaj Mimarlığı, Mimarlık ve İç Mimarlık bölümleri dersleri ortak yürütülmektedir. 2015 yılına kadar üç bölümün ortaklığında geliştirilen bu tasarım eğitimi 2015-16 güz döneminde itibaren Mimarlık Fakültesindeki tüm bölümleri kapsayacak şekilde strüktüre edilmiştir. Söz konusu ortak eğitim Temel Eğitim Stüdyoları (TES) başlığı altında ilk üç yarıyılta verilmektedir. İlk iki yarıyılta TES eğitimi Proje I-II, Basic Design & Visual Arts ve Visual Communication I-II derslerini kapsamaktadır. Üçüncü yarıyılta ise bölümler bazında özelleşmiş Project III stüdyo dersleri verilmektedir (<https://mim.itu.edu.tr/blog/2015/11/11/24697/>).

Dördüncü yarıyıldan itibaren öğrenciler Peyzaj Mimarlığı mesleğine yönelik olarak eğitimlerine devam etmektedir. Peyzaj Mimarlığı lisans eğitiminde peyzaj tasarımı ve uygulamaları, ekoloji, peyzaj planlama, doğa ve insan bilimleri, görsel iletişim, peyzaj mühendisliği, çevre yönetimi, meslek pratiği, konularında öğrencilerin bilgilendirilmeleri hedeflenmektedir. Lisans eğitimi tasarım ağırlıklı olup peyzaj mimarlığı stüdyolarında farklı disiplinlerden gelen uzman öğretim elemanlarıyla biraraya gelerek peyzaj mimarlığıyla ilgili sorunların ve çözümlerinin tartışıldığı interaktif bir ortamda çalışılmaktadır. Ayrıca, araştırma, veri toplama, sentez yapma ve problem çözme becerilerinin tasarıma yansıtılmasını sağlayacak beceriler ile tasarımlarda serbest çizim, teknik çizim ve bilgisayar kullanım becerileri verilmektedir.

Bu kapsamda İTÜ Peyzaj Mimarlığı Lisans eğitim programı, PEMDER (Peyzaj Mimarlığı Eğitim ve Bilim Derneği) ulusal akreditasyonunu 2022 yılında almaya hak kazanmıştır.

Çift Anadal Lisans Programları

İstanbul Teknik Üniversitesi Lisans Programlarına kayıtlı öğrencilerin yatay geçiş, dikey geçiş, çift anadal ve yan dal uygulamalarında ve bu uygulamalar ile başka programlarda ve/veya kurumlarda alınmış dersler ve kazanılmış kredilerin değerlendirilmesinde İstanbul Teknik Üniversitesi Yatay Geçiş, Çift Anadal Programı (ÇAP) ve Yandal Programı Yönergesi uygulanmaktadır (<http://www.sis.itu.edu.tr/tr/yonetmelik/YatayCapYandal.html>). Bölüm içerisinde yatay geçiş, dikey geçiş, çift anadal ve yan dal uygulamaları ile ilgili Çap ve Yandal Komisyonu; muafiyet ve intibak işlemleri ile ilgili ise Af, Yatay-Dikey Geçiş ve İntibak Komisyonu bulunmaktadır. Yatay yada dikey geçiş yapan öğrencilerin daha önce aldıkları ve başarılı oldukları derslerden muafiyetleri ve intibaklarıyla ilgili işlemlerde ise İstanbul Teknik Üniversitesi Muafiyet ve İntibak İşlemleri Yönergesi uygulanmaktadır (<https://www.sis.itu.edu.tr/TR/mevzuat/muafiyet-intibak-yonerge.php>). Bu doğrultuda tüm dersleri en az (BB=3.00) başarı ortalaması ile tamamlamış olan öğrenciler, 3. yarıyılın başından itibaren 'Çift Anadal Programı' / ÇAP yaparak iki diploma sahibi olabilirler. Öğrenciler başarılı oldukları takdirde İTÜ Mimarlık Fakültesi bünyesindeki bir programa, kontenjan dahilinde yatay geçiş yapabilirler.

LİSANS PROGRAMI UNDERGRADUATE PROGRAM

The undergraduate program in Landscape Architecture (BLA) is based on a six-semester curriculum. The first three semesters consist of several cross-disciplinary fundamental courses with students pursuing degrees in Architecture and Interior Architecture. The second half of the curriculum is field-specific. In addition to a cross-disciplinary design foundation, this approach also provides opportunities for seeking double major degrees and a transition between majors. Students who have completed the first three semesters with a GPA minimum of 3.00 are allowed to enter the double major program. At this point, students can also apply for a transfer between departments within the ITU Faculty of Architecture; Landscape Architecture, Architecture, Interior Architecture, Urban Planning, and Industrial Design. During the fundamental period, students learn about basic design and drafting techniques, architectural design and rendering, as well as an introduction to landscape architecture, the history and theory of landscape architecture, plant materials, natural systems and design, computer-aided design and information systems, landscape construction and site planning. At the beginning of the fourth semester, students begin their field-specific courses, which provide opportunities to discuss problems and solutions specifically related to the field of landscape architecture. The Landscape Architecture curriculum consists of 49 courses in total: 39 mandatory and 10 elective courses. The total credit hours are 152.

The main educational aims of the Landscape Architecture program are to prepare students for a professional career built on the visions of landscape planning and design, human and natural sciences, landscape theory and praxis with its well-grounded curriculum. The curriculum is supported by professional lectures, including landscape engineering (site planning) and construction, environmental management, and professional practices in terms of landscape design and practice, including drafting techniques and the use of relevant computer programs.

An emphasis is placed on training students' problem-solving skills in the design process and the application of scientific research methods; data gathering, analyzing, and synthesizing. Students in Landscape Architecture will be educated according to the ethics of the profession, such as efficient usage of resources, economic prosperity, and social justice, as well as preservation of social, historical, and cultural environment.

LİSANSÜSTÜ PROGRAMLARI

GRADUATE PROGRAMS

İTÜ Peyzaj Mimarlığı Bölümü lisansüstü programlarının amacı, peyzaj mimarlığında öncü araştırmacılar ve tasarımcılar olarak eğitilmiş; eleştirel düşünebilen ve icat edebilen; doğal kaynakların korunmasını ve sürdürülmesini ana problem olarak ele alan; mesleğin ulusal ve uluslararası standartlarını ve koşullarını yeniden yaratabilecek; kentsel ve kırsal çevrelerin tasarımı için gerçek tasarım fikirlerini oluşturacak bilgi ve yöntem üretebilecek adayların yetişebileceği bir akademik ortam sağlamaktır. Temel özgörü, peyzaj mimarlığı mesleğinin ulusal norm ve standartları için kriterleri belirlemede öncü rol oynamaktır.

Lisansüstü programlardaki başlıca araştırma konuları aşağıda yer almaktadır:

- Peyzaj Mimarlığı Tarihi, Kuramı ve Eleştirisi,
- Peyzaj Tasarımı ve Tasarım Kuramı,
- Mimari Tasarım, Kentsel Tasarım ve Peyzaj Tasarımı İlişkileri Peyzaj Ekolojisi ve Planlaması,
- Kentsel ve Kırsal Peyzaj Tasarım ve Planlaması,
- Degrade Alanların Islahı ve Planlanması,
- Peyzaj Konstrüksiyon Teknik ve Malzemeleri,
- Bitkilendirme Tasarımı ve Malzemeleri,
- Peyzaj Planlamasında Coğrafi Bilgi Sistemleri (CBS) Uygulamaları Peyzaj Tasarımında Bilgisayar Uygulamaları,
- Enerji Etkin Peyzaj Tasarımı,
- Sürdürülebilirlik.

Ayrıca, öğrencilerin, disiplinlerarası kuramsal ve uygulamaya yönelik araştırmalar ve çalışmalar yapması teşvik edilmektedir. Peyzaj Mimarlığı lisansüstü programları eğitim sürecinde, öğrencilerine, ulusal ve uluslararası alanda gerçekleştirilen proje ve araştırmalara katılma ve bu alanlarda çalışma olanağı sunarak profesyonel alanda metodolojik çalışma ve yaratıcılığın gelişmesini sağlar. Programdan mezun olan öğrenciler entellektüel ve bilimsel anlamda daha geniş bir vizyon kazanarak, ileri derecede araştırmacı, öncü ve mesleğinde uzmanlaşmış bilim adamları olma yetisini kazanırlar. Ayrıca, peyzaj mimarlığı alanındaki özel tasarım problemlerinde çözüm geliştirme ve geliştirdikleri çözümü uygulayabilme yeteneğine sahip olurlar.

Master of Landscape Architecture Program (MLA) and Doctor of Philosophy (Ph.D.) in Landscape Architecture Program

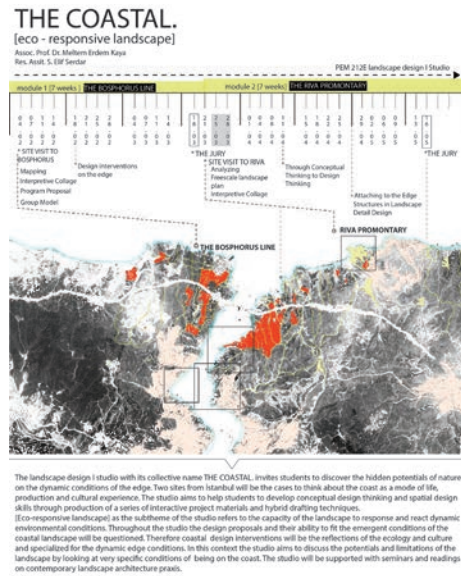

The Landscape Architecture graduate program has been active since the 2002-2003 academic year in the Faculty of Architecture of ITU. Before 2002, it was a Landscape Planning sub-program under the Urban and Regional Planning graduate program.

The goals of the Landscape Architecture graduate program are;

To train young scientists and academicians to enrich the faculty body; to develop cutting-edge research approaches in landscape design and planning; to promote interdisciplinary research; to educate people who will assume leadership roles in academic career or professional practice, the public sector and the private sector, to teach prospect scientists, who have a wide vision and expertise in their field; to set international norms in landscape architecture graduate education; to give students ability to develop their own research base and participate in national and international level interdisciplinary projects; and to trigger creative and critical thinking.

Research areas include,

- Landscape design, Architecture, and Landscape Architecture relationship,
- Urban Landscape Planning,
- Landscape ecology and design,
- Quality in Landscape Architecture,
- Urban design and landscape design,
- Ecological landscape planning and design,
- Natural and cultural landscapes,
- Landscape design in degraded lands,
- Landscape materials in landscape design,
- Urban furniture,
- Landscape construction.

PROJE I LANDSCAPE DESIGN I

Think, Feel, Breathe, Heal

Betül Eylül Akkaya

“Think, Feel, Breathe, Heal” was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Ebru Erbaş Gürler and Res. Assist. Çisem Demirel under the title “Garden Explorations” in the spring semester of 2018-2019.

To heal

Water tone and healing herbs help cure

To spend time

To spend time with neighbors and watch the landscape

To meditation

Relax and to spend time together

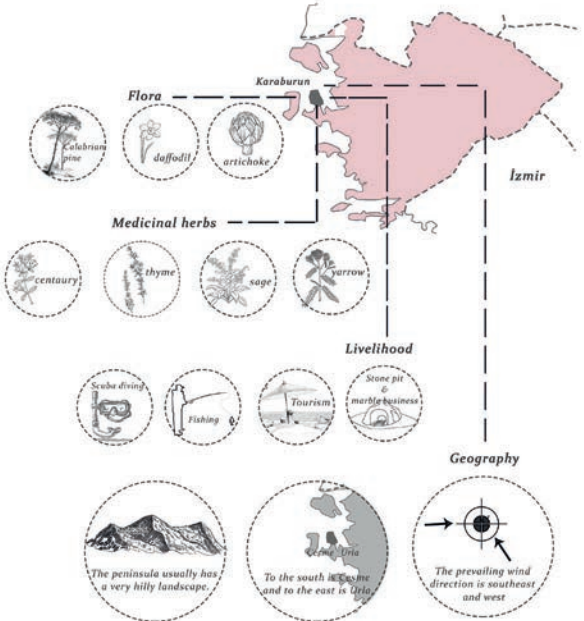

To plant

Provides more natural nutrition

To inspire

The garden is not just an escape and physical activity area.
Helps awaken the mind.

Gupset is the author.
She has a obsessive compulsive cleaning disorder.
She divorced and moved to Izmir with his daughter.
Her son is a scientist in Japan.
Her ex-husband is a traveler.
Her daughter is a student studying in Istanbul. In summer she comes to her mother.

Gubset allocates 40 hours of cleaning per week.

Gupset wakes up early in the morning to do the cleaning.

Denef gets up late and reads a book and spends time in bed.

Spends most of her time with his mother. Because of his mother's illness, Denef usually makes purchases.

Sometimes they spend some time at home

Denef loves her room so she can spend time in her room while her mother is working and cleaning.

Denef meditates together to help his mother heal.

Gupset and Denef eat together all meals

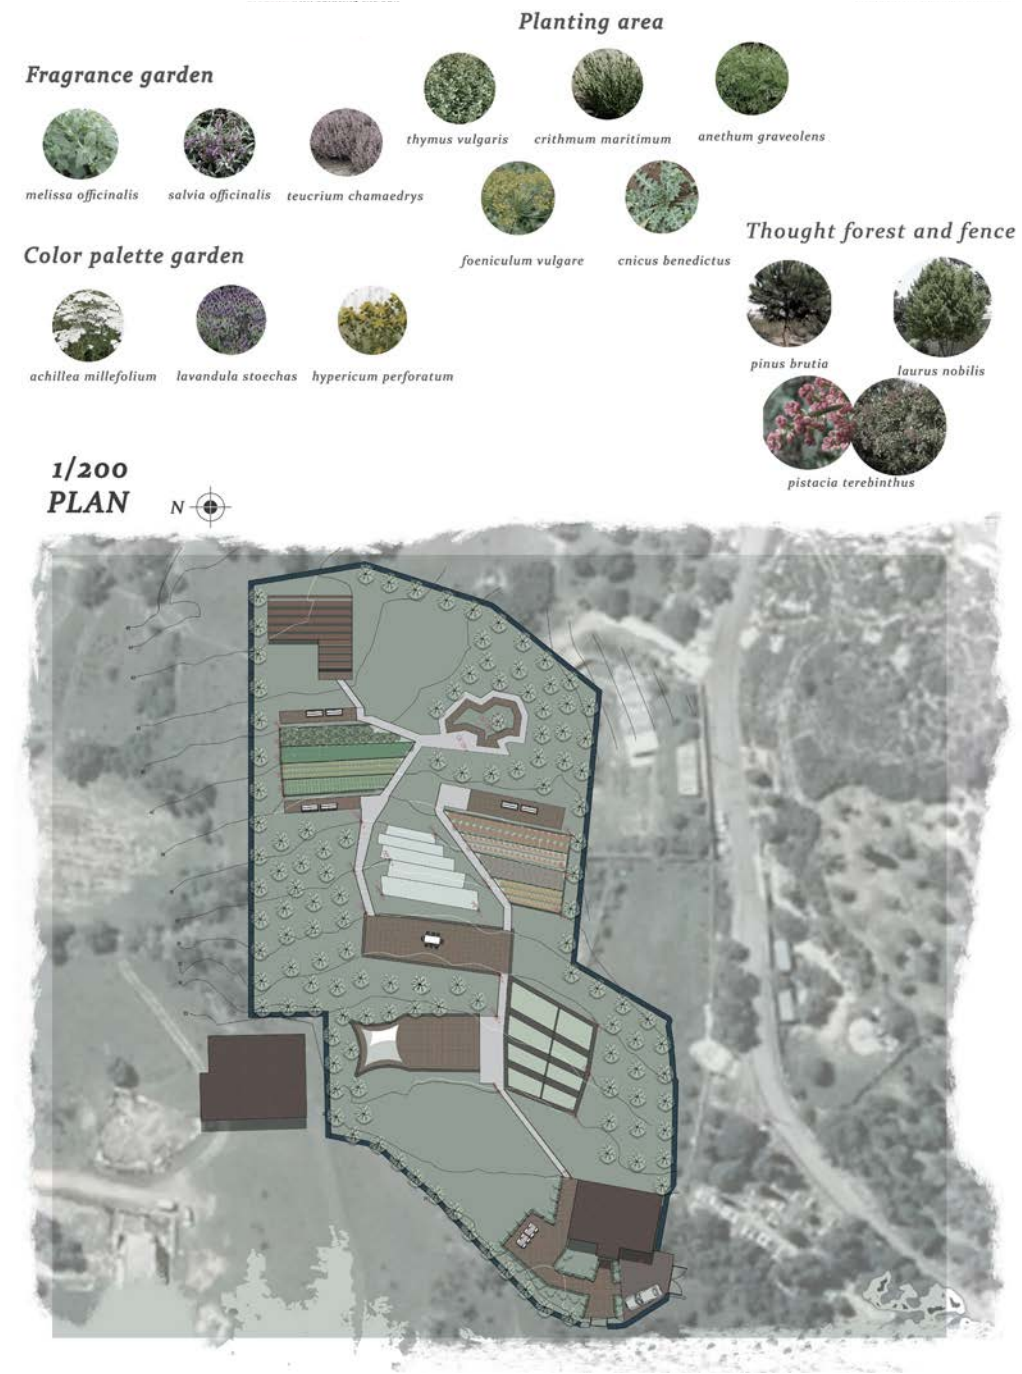

In winter, Denef returns to Istanbul and someone comes to help his mother

Divorce and meditation brings them closer and become close friends instead of mother-daughter

A Penny for Your History

Betül Eylül Akkaya

"A Penny for Your History" was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Çisem Demirel under the title "Garden Explorations" in the spring semester of 2018-2019.

A penny for your history!

Gatheraround Garden

Ayşe Ceren Yeşilbaş

"Gatheraround Garden" was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Çisem Demirel under the title "Garden Explorations" in the spring semester of 2018-2019.

General Features of the Area

The house and it's garden are located in Italy. The house was built in the forest 30m high from sea level. It takes 10 minutes to reach the beach, there is a rock path and stairs which lead people to the beach. In the forest, there is just a few number of houses, that's the reason why beach is never be too crowded. There are only few parasols in there. There is a dock to tie cones and let people to jump to the water. Sea is not too deep. The garden is surrounded by oak and pine trees. Different species of birds can be seen in the area.

Climate

A Mediterranean climate is characterized by rainy winters and dry summers, with less than 40 mm of precipitation for at least three summer months. While the climate receives its name from the Mediterranean Basin, these are generally located on the western coasts of continents, between roughly 25 and 38 degrees north and south of the equator. But the area where house is located is in a coastal area, so the soil is little more moist. The area takes rain in autumn but not as much as to ruin the trees in the garden. Also the region is mostly in the celcius of 18 to 25 degrees.

Activities

By the help of the location, there area can be defined as a place where you can do many activities such as: market shopping, swimming, relaxing in the beach, sunbathing, jogging in the forest, walking in the coastline, coneing and etc. The area is a place where you can find the many beauties of nature all together. Oaks, pines and other species can be seen in the huge forest. There is a small bazaar/ market is located in the coastline for the urgent needs of the few families who live in the area or for the visitors.

Garden Design

The garden was planned for the Brambilla family, who lives in Italy. The mom Claudia loves doing yoga, swimming and meditating. The dad loves to read his books on hammock and relax underneath the trees. Alec loves to play football and swim in the pool. Denise loves to sit next to water elements, planting and spending the in the garden with beautiful plants. Also the family needs a space to host the crowded family. So the area designed for the needs of the family.

Program

- Meditation Area
- Swimming Pool
- Planting Area
- Fruit Gardens
- Doghouse for Bob
- Veranda
- Pergola
- Hammock Area
- Transition to Forest
- Sensory Garden
- Common Space
- Secret Garden

How to Design?

The garden has to be designed while considered the needs of Denise. The area was huge and it had to be designed in a detailed way to avoid Denise to have trouble while spending time in the garden. Stairs are designed in the same width in the whole garden. In the areas which might let her fall, gravels are used to warn Denise. Little dots are made in the floor next to stairs to inform her that stairs are in front of her.

/Sensory Garden Idea

//Why?

A sensory garden is a garden environment that is designed with the purpose of stimulating the senses. These types of gardens are popular with and beneficial to both children and adults, especially those who have sensory processing issues, including autism and other disabilities. Denise is a blind girl, so the family wanted a garden which let their daughter can experience different senses. Except seeing, there are 4 senses: touching, hearing, tasting, smelling.

//How?

In the design of the garden planting areas are created to plant different species. Also some plants with different textures were used. The plants which create sounds by the help of the wind were used, also in sensory gardens water elements are commonly seen, in this garden water elements were also used. For the sense of tasting, different species of trees and plants were used, also the planting area will enable the tasting sense. Lastly for smelling, beautiful plants such as lavender that can be easily seen in Mediterranean area were used.

Storyboard

Denise woke up in her queen sized bed. She heard Claudia and Giorgio's laughters from their room. She always loved Sunday's, because it was the only day that she can spent time with her parents all day long.

After few minutes, she got up and walked through the window. She opened her window and the fresh air rushed inside. She felt the breeze in her face, smelt the delicious smell of newly baked bread coming through the breakfast table in the garden.

After having a family breakfast, Denise passed to the huge green garden. Bob passed near her and threw himself to the lawn. Denise noticed that he wanted to play. She plays with him for almost half an hour. While she was playing with Bob, Giorgio was already started to read his his book.

Denise called Claudia to plant the strawberry seeds that they bought from the villager market. Denise really loves feeling the soil, when she touches the ground she believe that she can feel all the beauties in the world. She felt the butterflies in the tummy.

After the planting, Claudia and Giorgio started to watch their favourite tv show: Friends. Claudia stops the show and her eyes started to search where Denise was. Denise was listening the peaceful voice of the fountain. She sit there for a few hours, while Claudia and Giorgio was finishing the season 7 of 'Friends'.

A normal day of Denise is spent as it's shown. The garden was not specifically designed for Denise but her special needs had to be considered while designing. Being disabled is not a disability to live the life in best way. The biggest disability is the boundaries we put in front of us. Denise might have started the life in disadvantaged a way but in years this garden will help her to understand how lucky she is to be alive in a world with thousands of natural beauties.

It was almost the lunch time, Denise was little tired because the sun was up. One of the maids calles Denise to lunch, she was waiting for this moment, she hold the arm of the maid and they started to walk throught the dining room from the garden. While walking to the garden Denise smelt a wonderful smell. She approached to the flowers, fulfilled her lungs with that incredible smell.

She spent the rest of the day with her family and her dog Bob. It was almost 7pm and the wind started to blow, but Denise wanted to pick the tomatoes that they've planted a few weeks ago. By the help of her mother Claudia, they collected the tomatoes for the dinner. Denise taste one of them and they were delicious. The maid helped her to carry the basket full of tomatoes. Claudia told the maid to wash the tomatoes for the dinner.

The families favourite activity is swimming, because Denise relaxes by the help of the water and also Claudia used to be a swimmer. She always tried Denise to love water. She achieved her goal.

Giorgio is a neuroscientist and a doctor. He loves reading books about neuroscience. He also follows the science magazines. He loves to spent his weekends reading books in the hammock.

/Other functions of the garden

The Brambilla family is quiet crowded. Claudia has two sisters and a brother. Also Giorgio has 2 brothers. Most of the family members are married and the have kids. This family's bonds are really tight. Even though some of the family members live in other countries, at least one in a month the family gather around for a weekend. They eat their meals in the garden with a lot of laughters while feeling a lovely breeze. They swim, they plant, they play football, they relax in the hammock. Also there is even a zen garden for meditation. Let's not forget the cute member of the house: Bob. There is a huge doghouse for Bob to rest.

Once or twice in a month, the whole family gather to the house. They always prefer this house because they all love Italy and the house has a wonderful garden. The huge space in front of the house is contains a dining area and living area at outside. The table is always prepared by the maids. When the dining time comes, everyone eats delicious Italian foods and the laughters won't stop until the end of the night.

Claudia does yoga almost everyday to calm herself. She was an landscape architect and she lived in NYC years so she had a stressful life. Also the reason why they came in Italy was to life a peaceful life. So yoga is her bestfriend in Italy.

This is Bob's house but Bob never stays in the hut because he loves Denise so much, sometimes he prefers to sleep in Denise's bed. His best friend is Denise.

The GatherAround Garden

The garden consists of 16 significant areas. There are 3 veranda/ pergolas for the members to dine and spend time together. There are two water elements in the area: one of them is the swimming pool which is located in front of the house and the other is in the Zen garden. Zen garden was designed as a place to fulfill the meditation need. Also there is secret area which you can reach by passing the citrus trees. It is for relaxation, hammocks can be find in there. In the upper parts of the garden a huge winter garden welcomes you, there is a fireplace in the dining/living room of the winter garden. Family loves to spend time in there because a beautiful view can be seen. There is a huge lawn area for Alec to play football with his friends.

- 1: The house

- 16: Transition to the forest

The GatherAround Garden

Also the sensory garden idea can be seen all over the garden. Next to the house there is a water element and planting area, by the rising level, fruit trees and sensory plants area can be seen. In the sensory garden level, plants with good smell, such as lavender can be seen. Also for the touching feeling mischantus and other grass types can be found. Also there is a common space area for experiencing the beautiful and natural view. It is one of the spectacular vista points in the garden.

The Collages of the Garden

Three different and significant areas which are defining the characteristics of the garden. For meditation, an area was designed with gravel, water element and acer palmatum trees. Swimming pool was designed in two different levels to let Denise swim easily and safely. And the third collage was created to show how the level difference problem was solved. The difference was solved by terracing the whole garden while considering the natural topography to avoid ruining the nature.

ZEK-exchange

Ayşe Ceren Yeşilbaş

"Zek-exchange" was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Çisem Demirel under the title "Garden Explorations" in the spring semester of 2018-2019.

Zek-Exchange aims to bring together two distinct groups of people living in the Zekeriyaköy area. These groups primarily earn their income from two sources: (1) Agriculture & Husbandry, and (2) Other professions. The main goal is to create a space where these two groups can come together and exchange knowledge. People with different skills and interests can share their expertise. For example, in this space, farmers can teach the other group how

to care for animals, grow simple vegetables and fruits, and learn to connect with nature. On the other hand, the more educated group, which is up to date with modern technology, can teach farmers how to use technology and stay informed. The concept aims to bring these two groups together in the same space to exchange skills and knowledge.

//Chooosen 21st Century's Learning Technique, is the main method where people can learn anything, anywhere, anyhow. Communicating has a key role on education. Talking and exchanging information with others is beneficial for both sides.

being close to the nature, planting, jam making, tea collecting, being close to animals, knowing the area better, having more experience in life

knowing technology well, having better planning skills, access to new selling techniques, being more update

//Group I

These people mostly earn their incomes by farming. They are mostly poorly educated but they are skilled when it comes to work in the fields like agriculture, husbandry. Most of these people were born in the area -in the villages named Zekeriyaköy or Uskumruköy-, and continue to live in that area. They are into planting and most of the food that comes into their houses are organic because almost all of them are growing their plants in their frontdoors.

//Group II

These people mostly earn their incomes by working in the jobs which mostly require university diploma. They mostly prefer to become architect, doctor, engineer, managers etc. These group of people are mostly older than the age 40. They decide to move to this part of the city to get away to stress of the cosmopolitan city and they were probably did not born in the area. They live in the area to be more close to nature but they generally do not spend time with the nature enough.

/annual planting chart

The area was designed to provide a natural atmosphere that brings together people with different lifestyles. Activities such as planting, participating in workshops, and enjoying the green spaces will allow everyone to embrace the beauty of nature in Zekeriya köy. The common spaces will help people communicate and learn together. These spaces will foster communication and learning while allowing people to connect with the beautiful surroundings. Additionally, people can enjoy the area in both winter and summer, as the common spaces are ready to welcome every visitor.

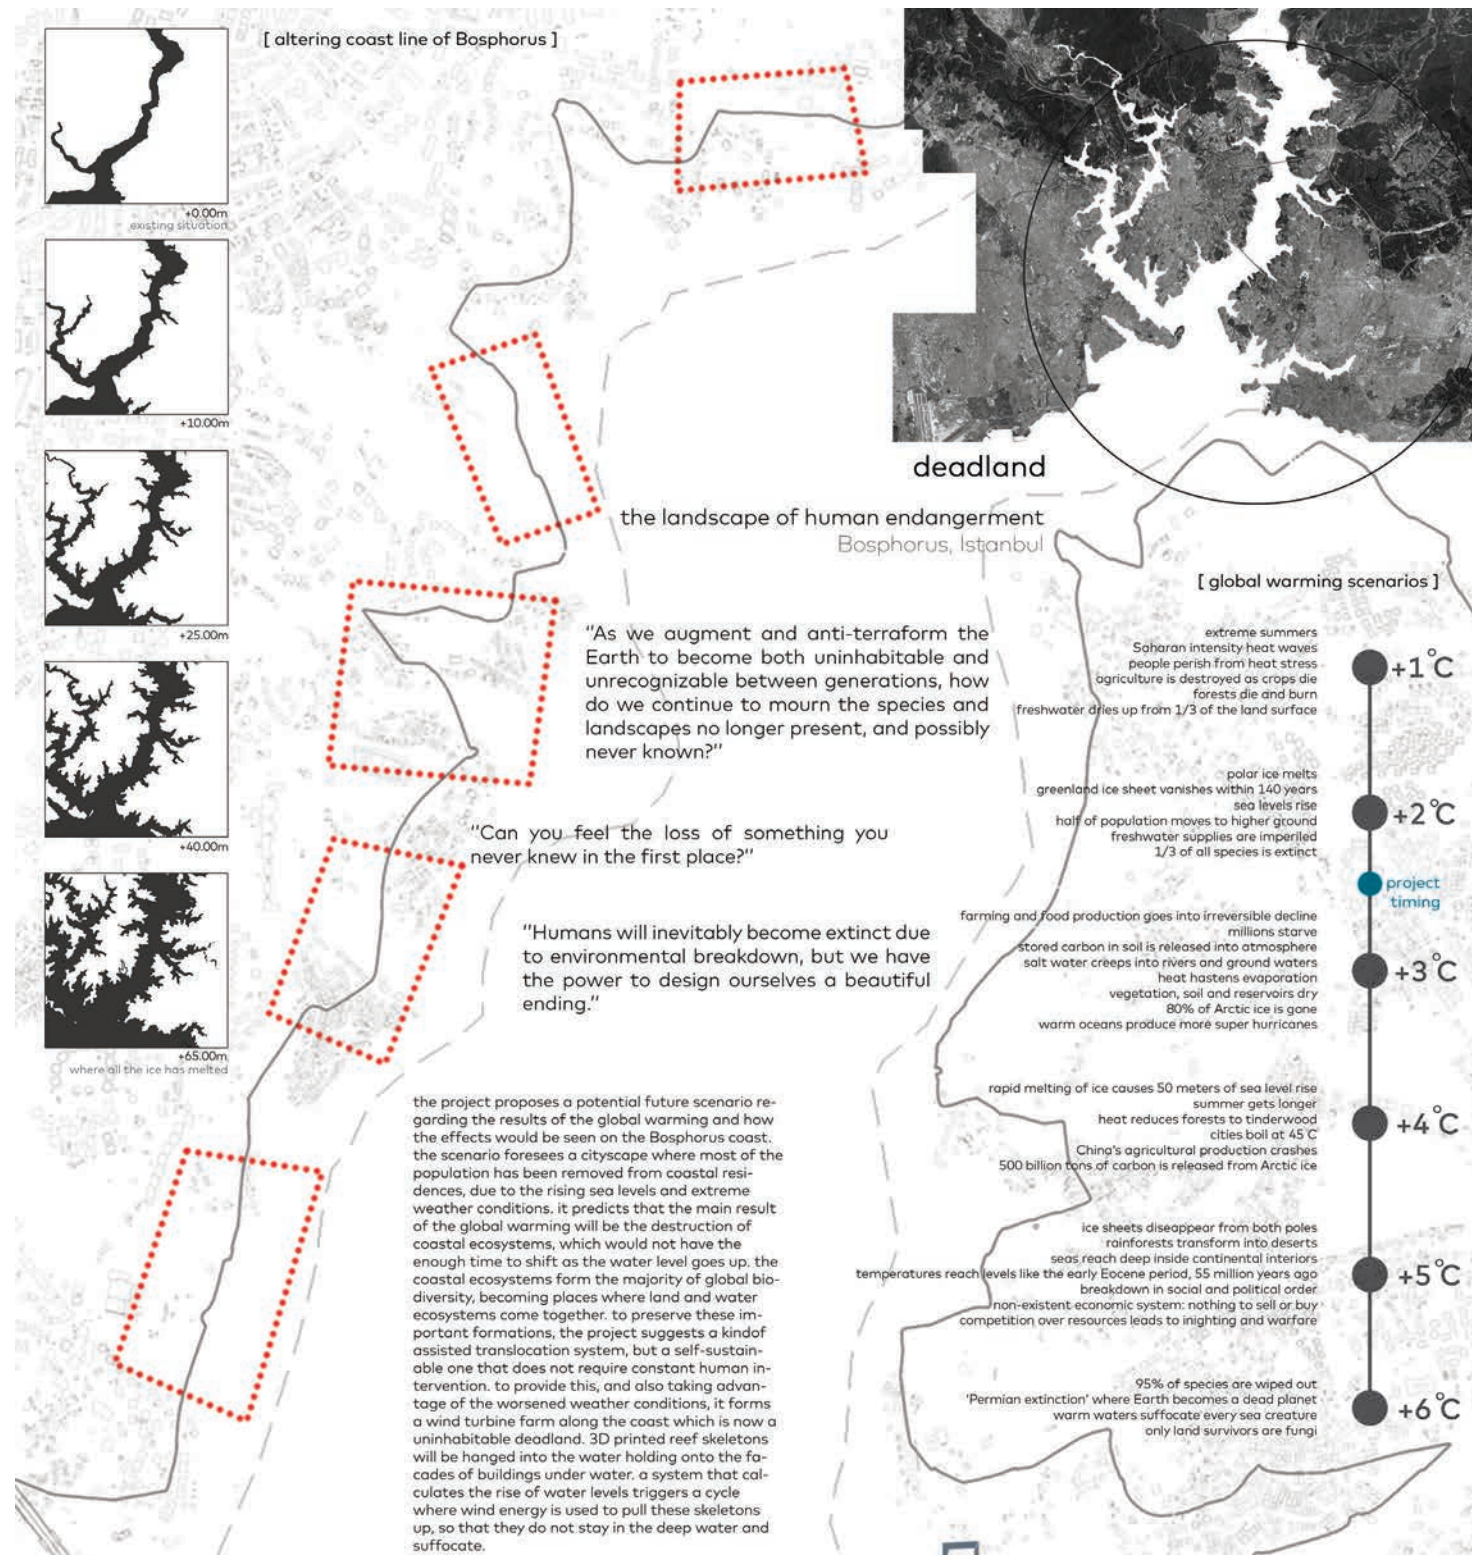

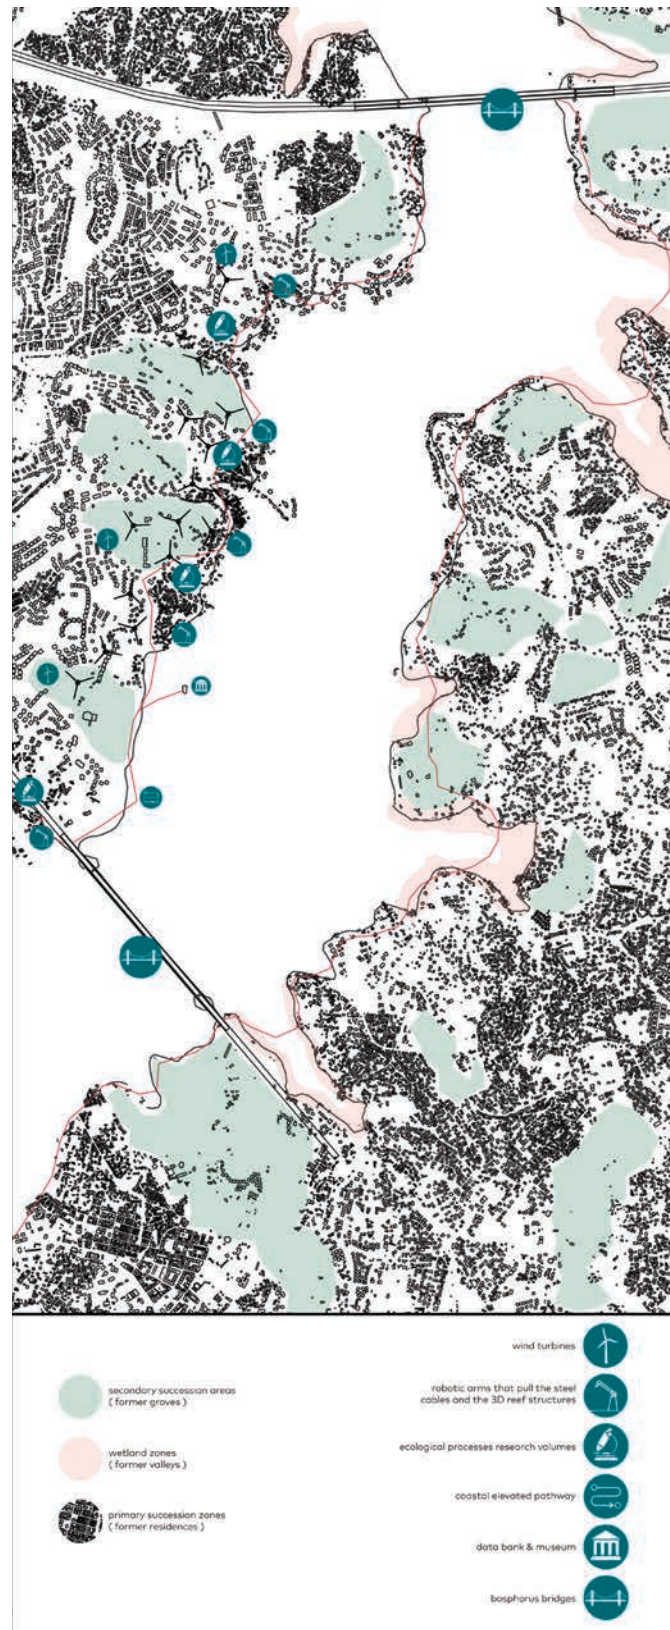

Deadland

Arda ořan

“Deadland” was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Elif Serdar Yakut under the title “The Coastal. Eco-responsive Landscape” in the spring semester of 2018-2019.

[responsive solutions]

producing motion energy from wind for the aim of a self-sustainable system

patch relations between primary and secondary succession zones

low level salty water zones that are encouraged by cove structures and stream

..... natural movement of the species
— accelerating this movement with a system

the formation of naturally formed coves (former valleys) as wetland zones

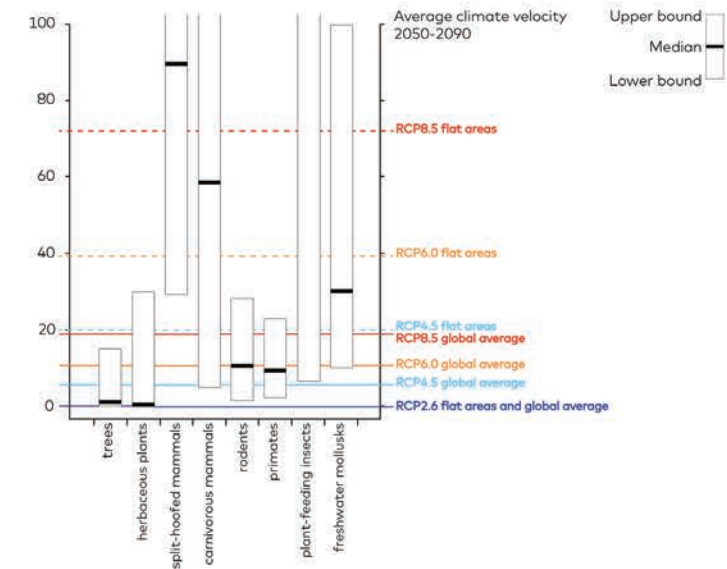

elevated human intervention

[species]

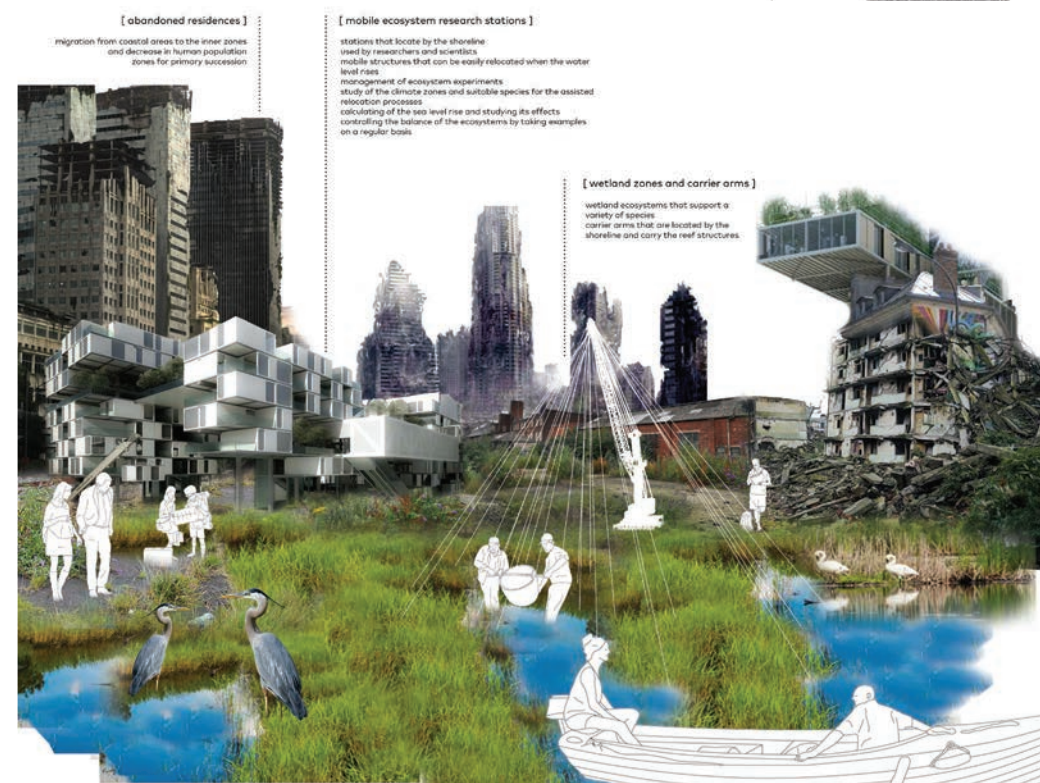

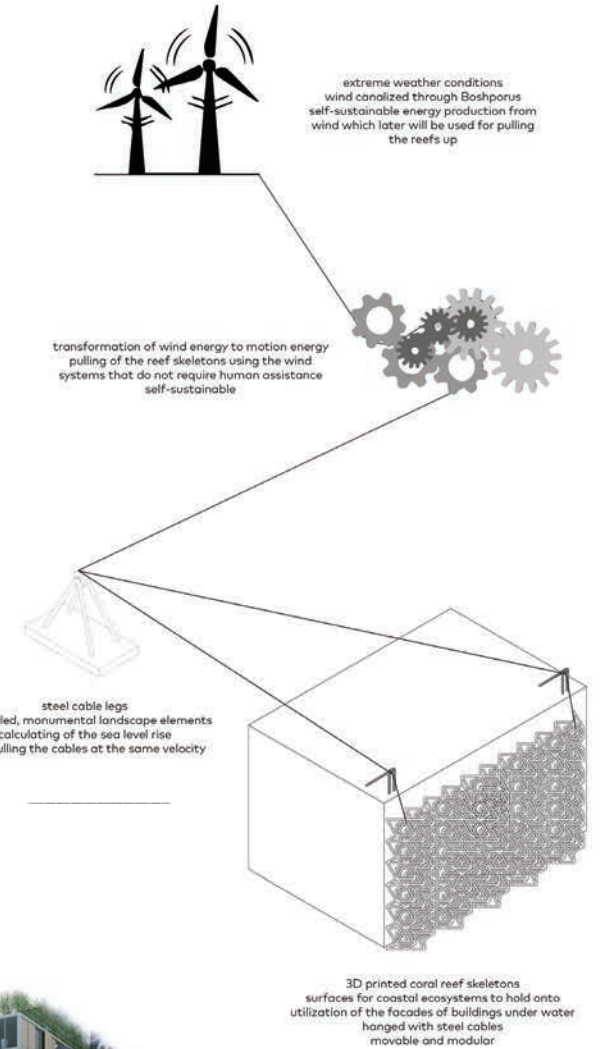

[maximum speed at which species can move km/decade]

assisted translocation (assisted migration, managed relocation, assisted colonization) theory suggests to relocate species that have no ability to adapt to rapid climate change, in order to preserve lands, waters and biodiversity; assisting native species moving upslope, poleward or toward climate refugia allows climate adaptation, species that are not capable of shifting their habitats at the same pace as the climate change become most vulnerable and potentially extinct, therefore in need of assisted migration, but many of these species will be unable to track suitable climates under mid- and high-range rates of climate change, such action is risky and debatable, but it may be considered as the only option left for specific species.

[assisted translocation of species]

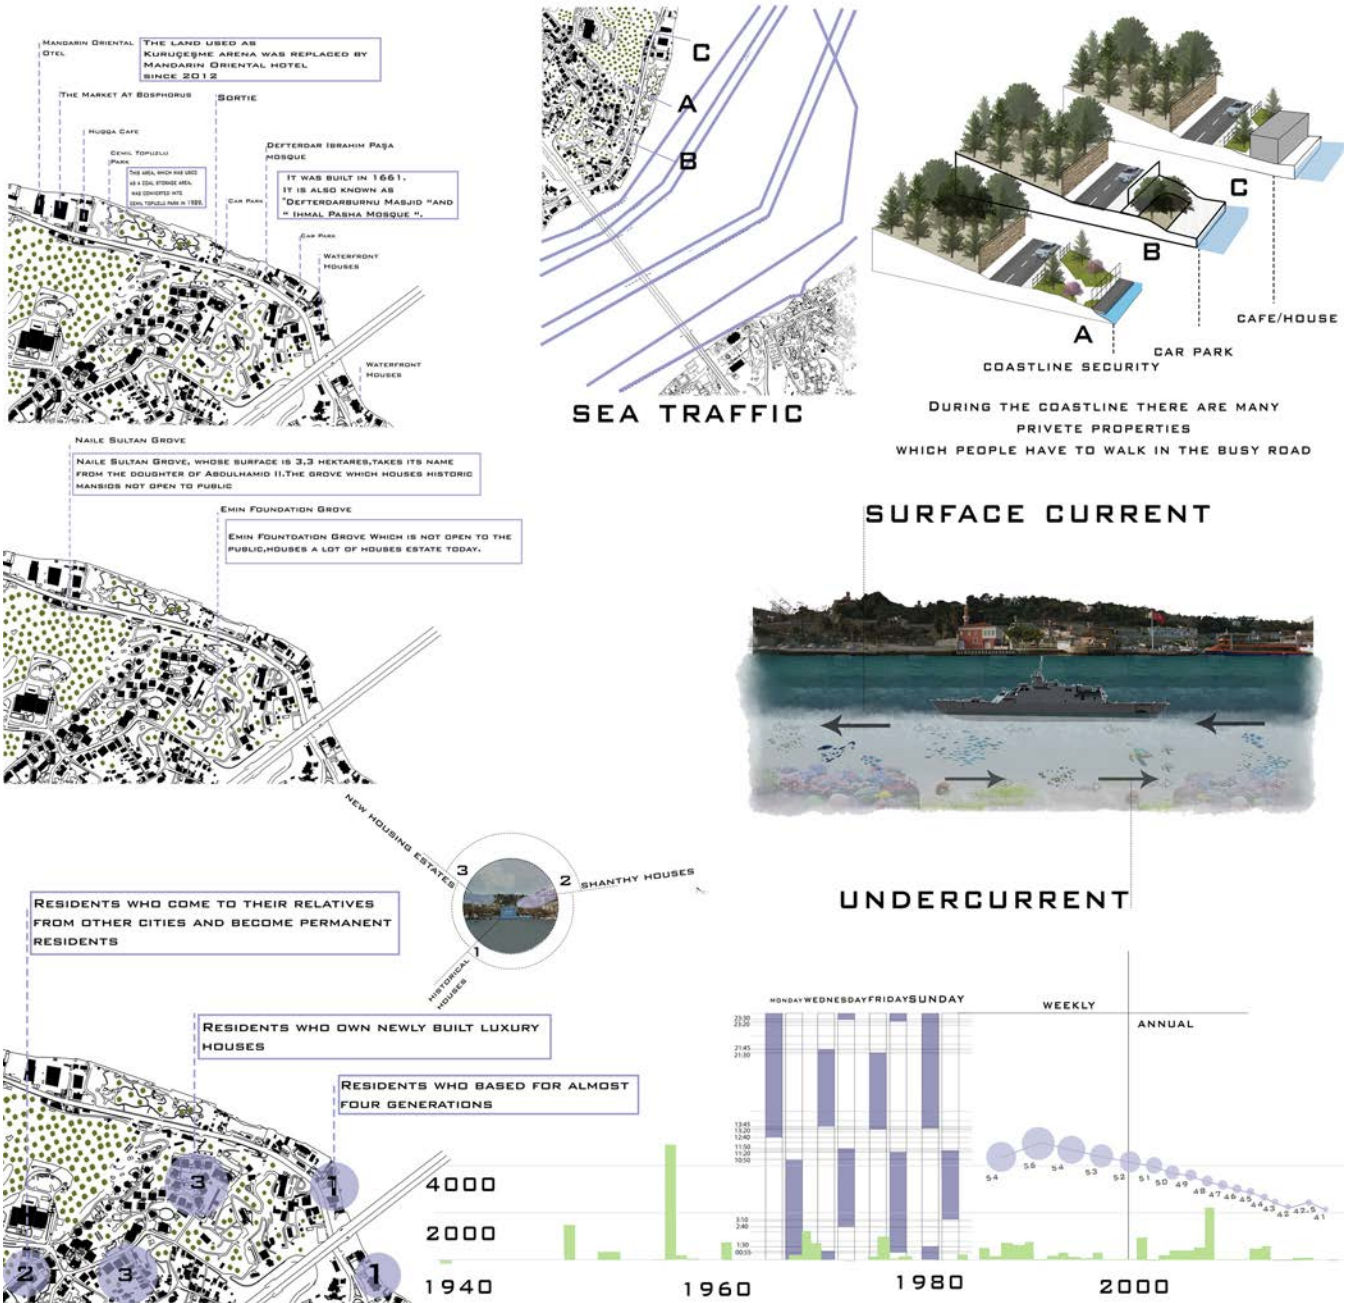

Walking Modules

"The Riva Promontory" was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Elif Serdar Yakut under the title "The Coastal. Eco-responsive Landscape" in the spring semester of 2018-2019.

population: 2.237
density: 99.2
socio-economic status: A

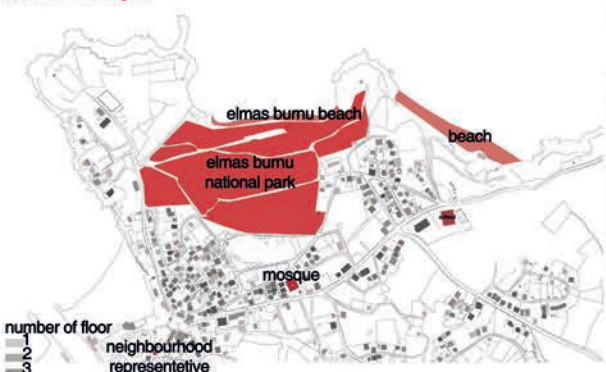

transportation

In riva, public transport is only available as a public transport, and private vehicles and taxis are available. transportation to the coast is difficult because of the cliffs, so pedestrian transport is more convenient.

- primary road
- second road
- pedestrian road

land use analyse

coastal use of riva

çayağzı stream, is a river located on the kocaeli peninsula, north of the marmara region. it is suitable for boat use. local fishing activities are also carried out. however, in recent years, industrial facilities and wastewater have been subjected to a major pollution problem due to the fact that they are discharged into the creek without complete purification.

street conditions

street flooring in settlements is not uniform. stone pavement is used in the street pavement and in some areas it is possible to see gravel or paving. street widths are not constant because the settlement in the area is uneven.

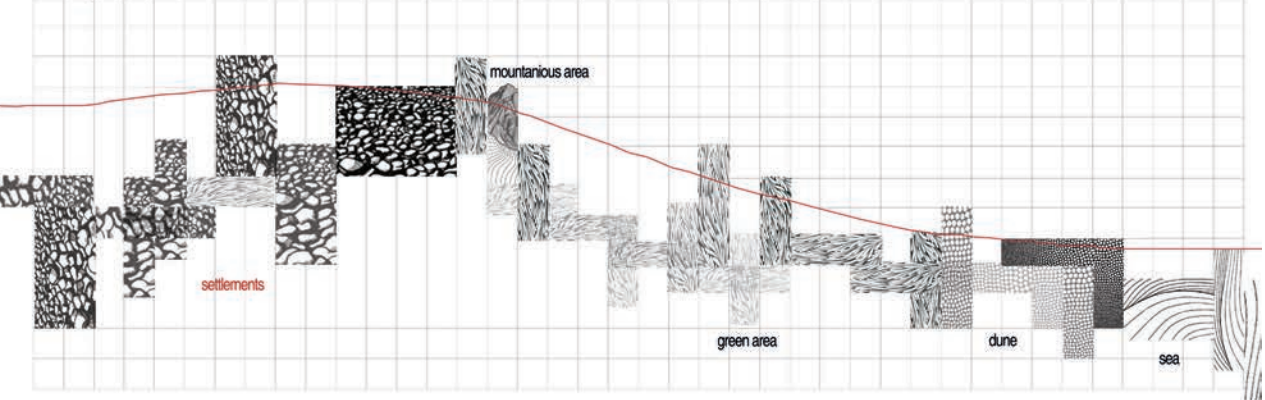

wall, fence, wire and similar structures determine the width of the streets. these structures, which form the street boundaries, are generally 80-100 cm high.

in some areas, street structures can be converted into soil. the width of such streets is determined by the boundaries of the surrounding vegetation.

texture analyse

flora and fauna of riva

there are different kinds of soil types in riva, but in our project area, it consists two soil types; lime brown forest soil and sandy soil.

lime brown forest soil: the top soil is soft or slightly firm. the lower soil is heavier and harder. although lime is washed, the reaction is neutral or alkaline. natural drainage is good. natural vegetation is a mixed forest or shrub.

plant species which grows in this soil: quercus sp., arbutus unedo, phillyrea latifolia, pinus maritima, pinus pinea, spartium junceum, cistus creticus, laurus nobilis, sarcopoterium spinosum.

sandy soil: they contain 80% of sand. they are easy to process. they require plenty of water because they do not hold water. this causes the food in the soil to be washed away. it is poor and usually acidic soils.

plant species which grows in this soil: panerarium maritimum, paliurus aculeatus, oltanhus maritimus.

area also have some animal species like apodidae, tragopan melanocephalus, talpa europaea and scuridae.

coastal characteristics of riva

green area analyse

riva is a residential area on the coast. therefore, wave and wind densities are very effective. the wave direction in our area is perpendicular to the shore. the wind direction is from the sea to the shore line. it has a topographically protruding structure. this allows for various natural formations. it has a more classic structure. at the same time there are dunes in the coast.

there are plenty of green areas in riva. they have different kind of textures. this can be listed as medium, fine and coarse texture. there are also sandy areas because of beaches. in sandy areas, sandy soil exists. a few plants that grow in sandy soil written above. medium texture mostly contains of mixture of trees and shrubs; the texture equals to the forest areas; coarse texture mostly has groundcovers and shrubs.

Riva Promontary- Learn, Know, Love and Protect

Ecem Torun

“Riva Promontary- Learn, Know, Love and Protect” was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Elif Serdar Yakut under the title “The Coastal. Eco-responsive Landscape” in the spring semester of 2018-2019.

RIVA HAS AN IMPORTANT PLACE FOR THE NATURAL LIFE IN ISTANBUL BECAUSE IT IS ON THE MIGRATION ROUTES OF THE BIRDS AND IT CONTAINS NATURAL PARKS WITH IS PROTECTION AREA.

THE PROJECT WAS AIMED TO TRANSFORM THE AREA INTO THE PLACE FOR BIRDS AND PEOPLE.ITS AIM IS TO USING NATIVE PLANTS ACCORDING TO THIR CLIMATE.

THE AREA IS LOCATED IN RIVA AND SURROUNDED BY ELMASBURNU NATIONAL PARKS. IT WAS USED AS A PRIVATE BEACH. THERE WAS A CAMPING AREA AND CAR PARK.

THERE IS TWO CAR AXES NEAR THE AREA.

THE AREA IS DIVIDED BY THREE MAIN AXIS WITH RADIAL GEOMETRY. TOP OF THE AREA WAS USED AS A CENTER.

BY USING TOPOGRAPHY LINES , SHARPY FOLDS WERE CREATED.

EVERY PARCEL IS GAINED DIFFERENT FUNCTIONS.

VISITORS CAN OBSERVE BIRDS AND PLANTS AS THEY READ INFORMATION ABOUT BIRDS AND PLANTS

WHILE THEY WERE WALKING TO THE BEACH, BECAUSE OF THE ELEVATION DIFFERENCES BIRDS WOULD NOT BE DISTORB BY THE HUMAN ACTIVITIES.

B

IN PSEUDOMAQUES TERRACES, VISITORS CAN WALK ACROSS THE SHRUBS AND REST.

IN THE ENTERENCE, THERE IS PAVILION THAT PEOPLE CAN GET INFORMATION ABOUT THE PARK.

F

IN DESIGN, THERE IS A VIEW TERRACES BETWEEN THE AXES. PEOPLE CAN SIT AND ENJOY THE VIEW.

K

THERE IS MOUNDS WHICH HAVE A DIFFERENT LEVEL. VISITORS CAN CLIMB AND SIT THOSE MOUNDS.

IN DESIGN, THERE IS THREE AXES. ONE OF THE IS STRAIGHT TO THE SEA. OTHER TWO AXES IS ENDED AS A TERRACE.

G

C

IN THE DESIGN, THERE IS SHADE GARDEN. PEOPLE CAN SIT UNDER THE PAVILION.

H

One of the features that makes Riva an important location for the city of Istanbul is its transitional role within the city. Therefore, when analyzing Riva, its relationship with Istanbul should be considered rather than its existence in isolation. In this respect, Riva exhibits both urban and rural characteristics.

In terms of usage, Riva is primarily a destination for beach tourism, especially during the summer months. Additionally, Riva contains natural parks, including Elmasburnu Nature Park, which is located on both sides of the area where the design will be implemented. Another significant feature of Riva is its importance for birdlife. Migratory birds, in particular, rest in Riva during their passage through the Bosphorus. This makes Riva one of the key bird-watching locations.

Given these features, two main characteristics emerged in relation to the intended design. The first aim was to bring humans and birds together within the design. The goal was to contribute to tourism, while also raising awareness of the accommodation area, which was at risk of being lost, by creating a space for the birds to rest. The second objective evolved from the first, focusing on the use of natural vegetation.

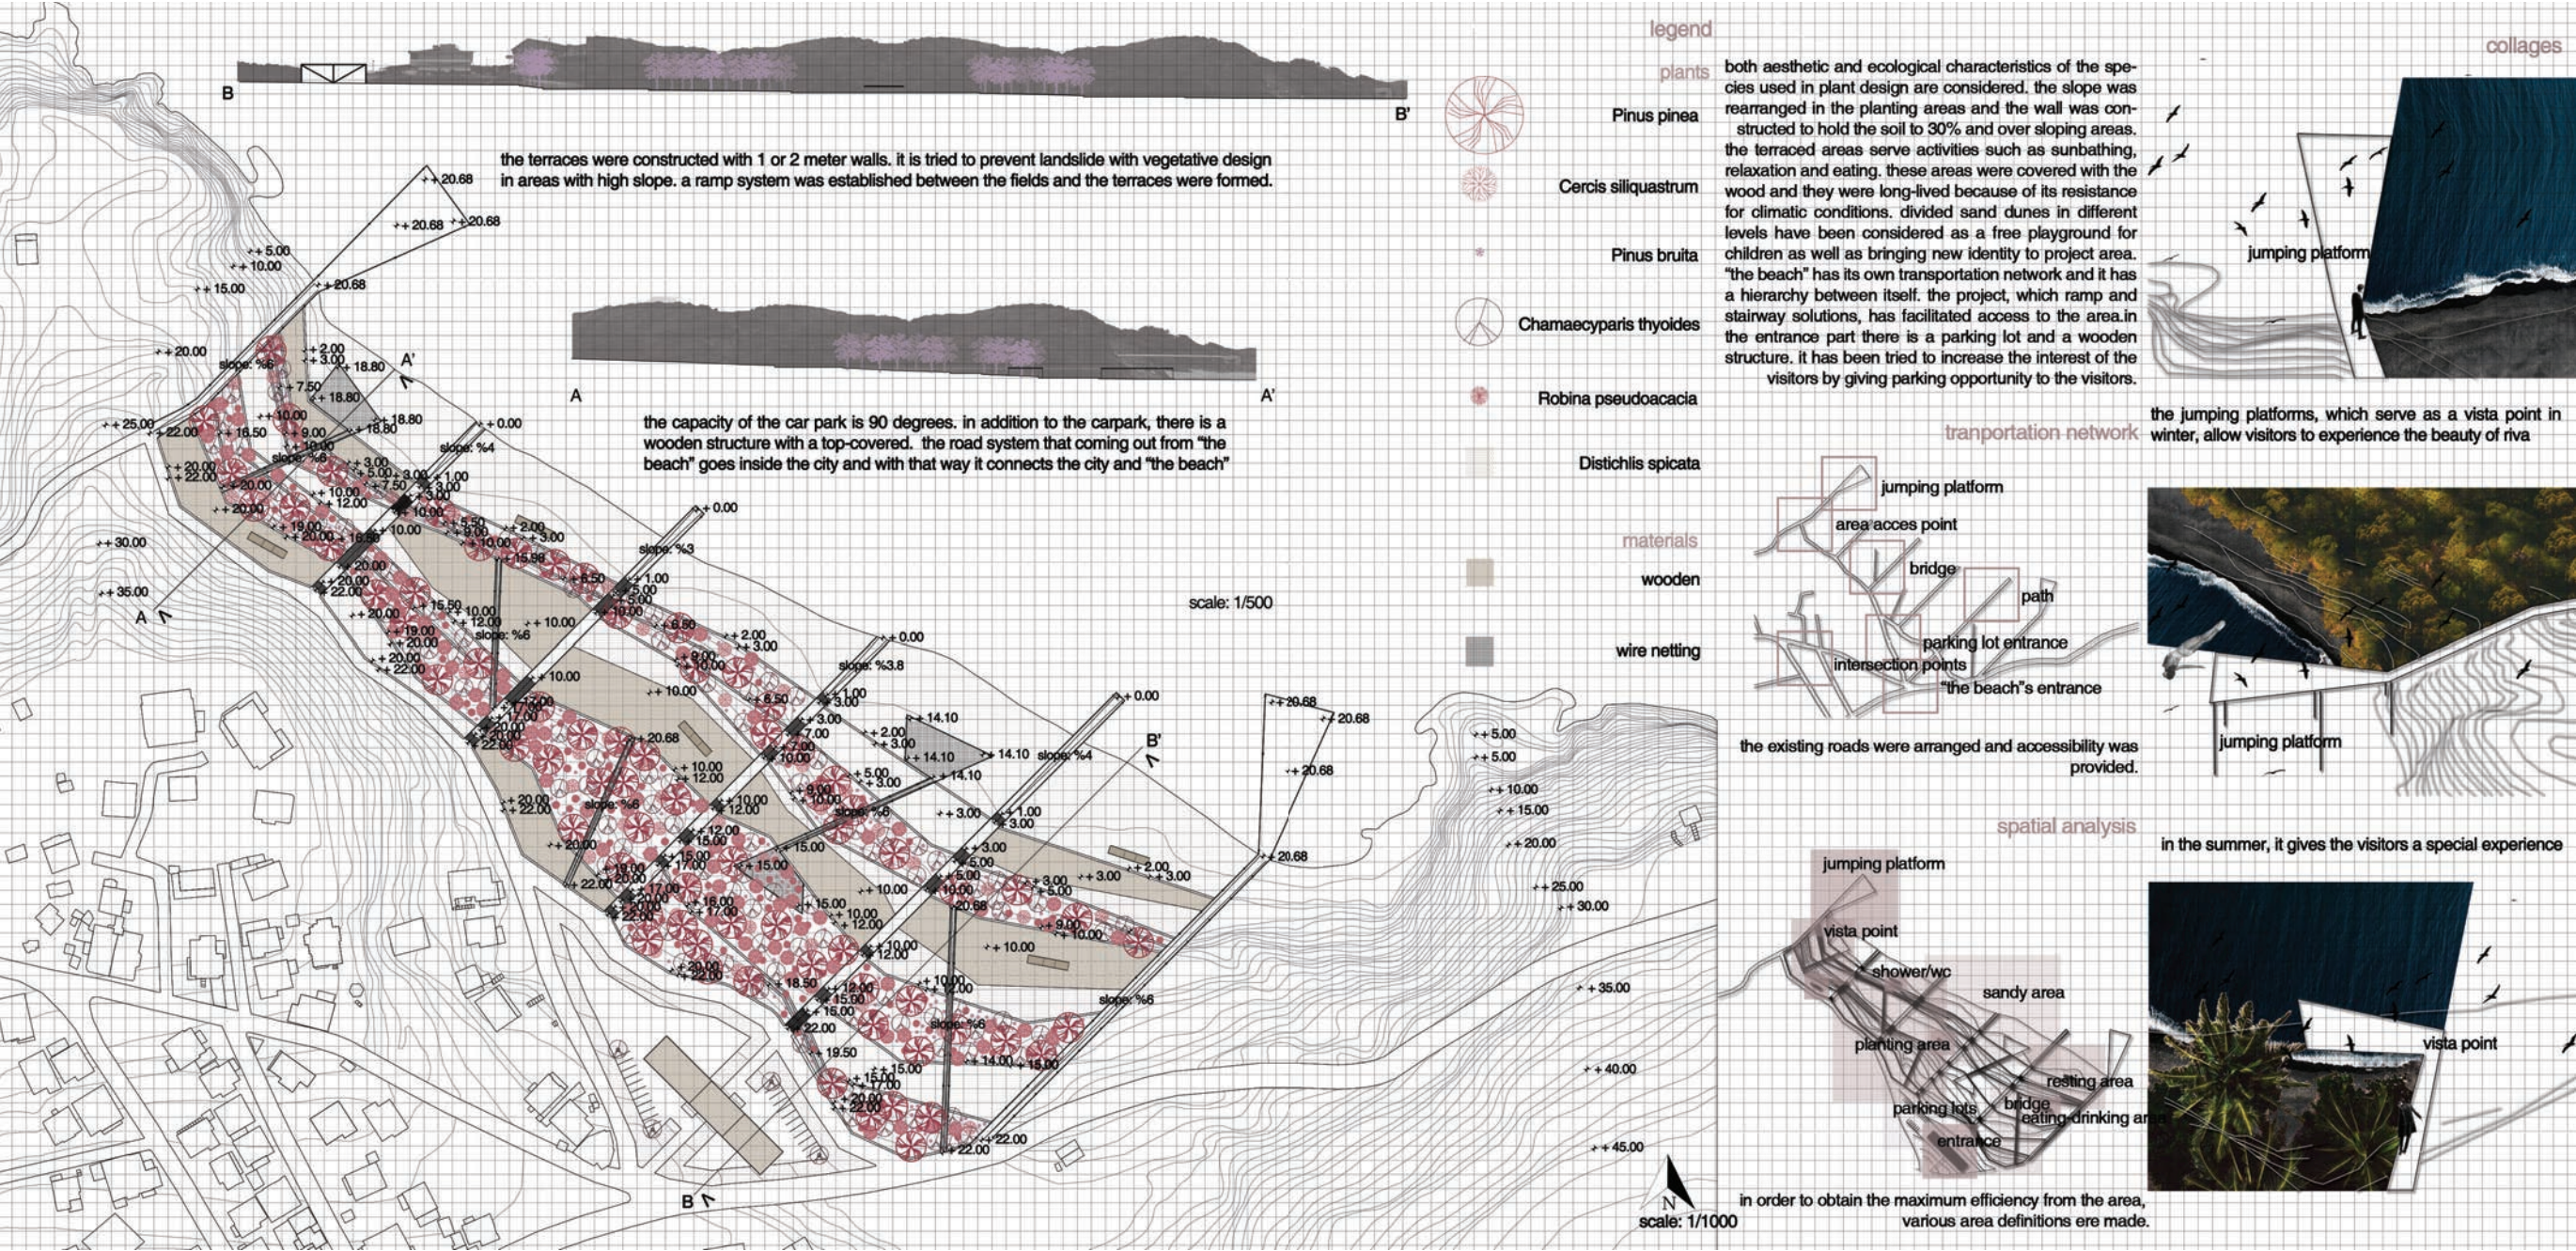

Riva is home to diverse vegetation, including maquis and pseudoma. In the design, the existing topography was utilized and accentuated. To ensure continuity, different areas were created by following a systematic design approach. These areas were categorized according to the characteristics of the maquis and pseudoma vegetation. The created areas include an exhibition garden, birdwatching gardens, pseudoma terraces, maquis garden, and viewing terraces.

To enhance the connection between the area and the sea, a radial geometry was introduced, with straight axes directed toward the sea. Along with alternative pathways, this design increases the relationship between the area, the beach, and the sea.

The Beach - The Riva Promontary

Yağmur Özgüner

"The Beach - The Riva Promontary" was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Elif Serdar Yakut under the title "The Coastal. Eco-responsive Landscape" in the spring semester of 2018-2019.

Dream Up

Yağmur Solaz

“Dream Up” was produced within the scope of Landscape Design 1 carried out by Dr. Meliz Akyol and Res. Assist. Elif Serdar Yakut under the title “Human” in the spring semester of 2019-2020.

USER'S PROFILE

explore experience adventure interaction

The kindergarten, located on the Ayazağa Campus of Istanbul Technical University, is closely connected with nature. The garden of the kindergarten is filled with pine and cedar trees. However, there is currently no playground for children, other than the typical

plastic, mass-produced play elements. The design aims to create a playground within nature, where children can use their imagination to design their own games and play freely.

Instead of a play element that tells children what to do, the aim is to provide a suitable space where they can create their own games. The design seeks to support both the motor skills and mental development of children. A free environment was created by designing a playground with hills of varying heights and materials. Different heights offer children unique perspectives, while varying

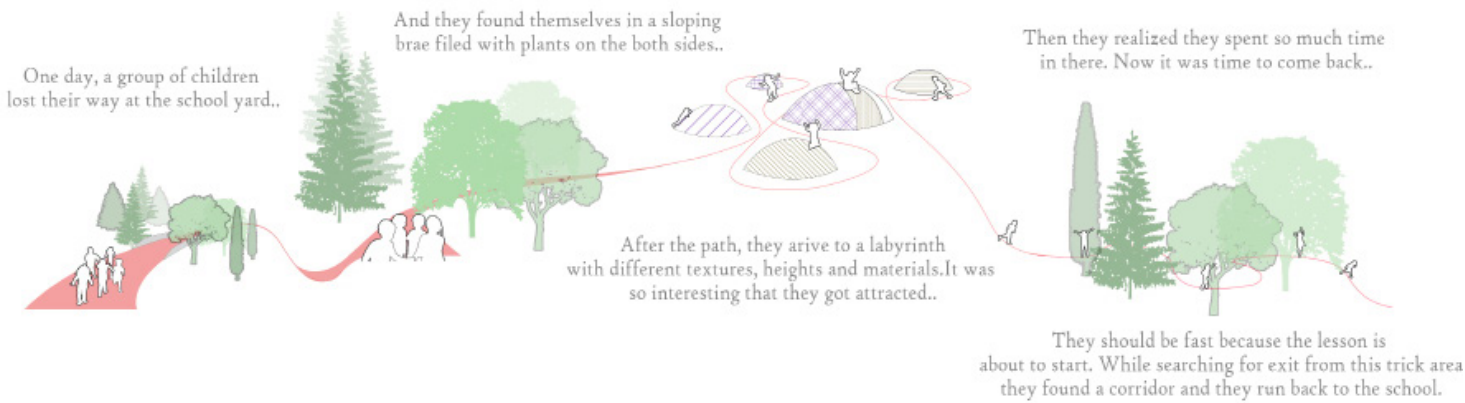

materials enable different functions. The playground includes rough surfaces, slippery areas, soft floors, hard floors, and green spaces. The changing heights, materials, and colors encourage children to use their imaginations and create their own games. At the same time, the playground is suitable for all age groups, allowing different ages to play together. Younger children can play

Vortex

Merve Dilara Ezer

"Vortex" was produced within the scope of Landscape Design 1 carried out by Dr. Meliz Akyol and Res. Assist. Elif Serdar Yakut under the title "Human" in the spring semester of 2019-2020.

Zones & Circulation

The design was created based on a fictional story. According to the story, when a group of children leaves school, they lose their way in the garden and find themselves in a mysterious passage. After crossing the path, they encounter a maze. This labyrinth is particularly intriguing because it features varying heights and materials, and the children lose track of time as they explore it.

Approach
The slope analysis and usage density analysis, which I conducted on the site beforehand, were significant influences on my design. The decision to reduce the slope by extending it towards the wall at the bottom, combined with the strategy of spreading the usage density from the central area to the walls, formed the foundation of my design.

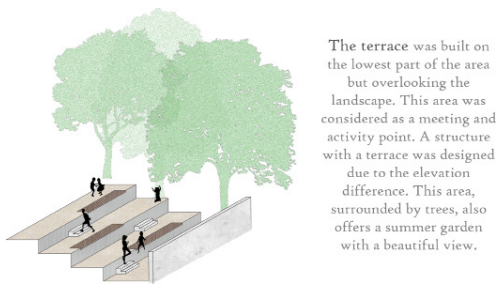

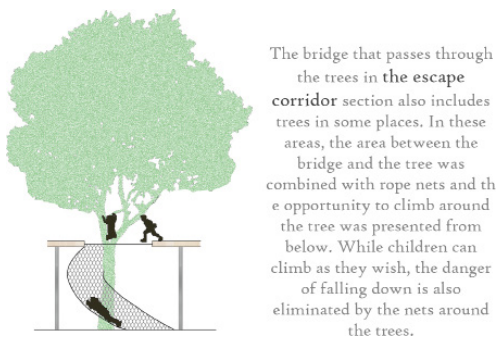

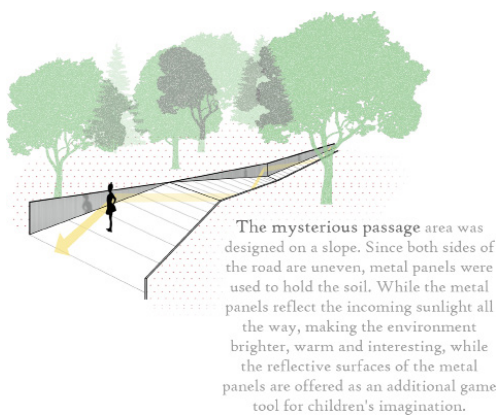

1- Mysterious Passage

2- Labyrinth Mounts

3- Escape Corridor

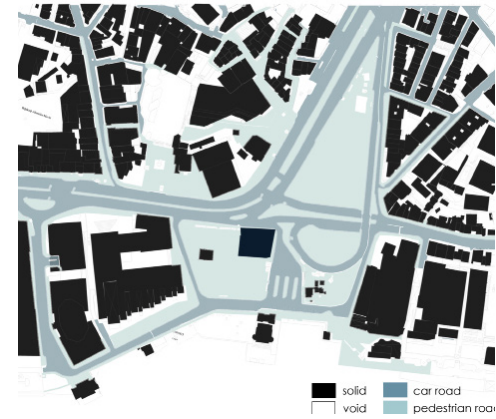

All From

Nuran Kul

"All From Lines" was produced within the scope of Landscape Design 1 carried out by Dr. Meliz Akyol and Res. Assist. Elif Serdar Yakut under the title "Human" in the spring semester of 2019-2020.

The project "All from Lines" has transformed Beşiktaş into a space that facilitates regular and accessible use, creating a sustainable urban open space in the post-pandemic era, while also addressing systematic trends in landscape architecture. The "All from Lines" project aims to solve several problems faced in our open and green spaces through a new system. It seeks to redesign this square, which is used by 10,000 people daily, by creating open and spacious areas that are free from complexity and offer a sense of dignity, achieved by dividing the space into functional zones with a linear design.

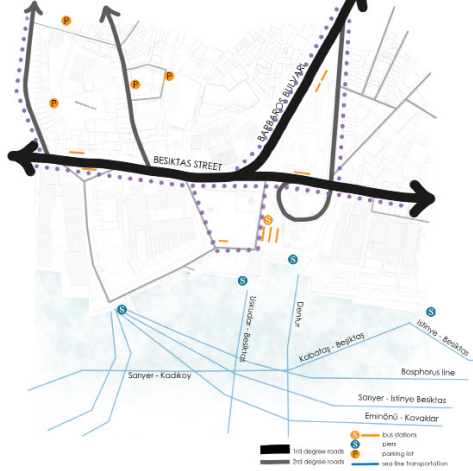

void

pedestrian way / density of people

route and transportation

UNITS

PROCESS

Way to get linear system with true configuration in Beşiktaş.

DETECT → defined areas (open spaces, private spaces, builds etc.) transition points main axis intersections stations protected cultural heritage urban structures car directions

DETAILING → intersections of lines which is functional crossing

This is critic for direct people and car in Beşiktaş. Because Beşiktaş is one of the key point of Istanbul. Beşiktaş, which is used by many people as a transit point, has a daily sea passenger capacity of only 33,000 people. Consequently, Beşiktaş pier is exposed to a very crowded people on the southern shores of Istanbul.

Category	Value
Population	10,000
Area	1,000
Population Density	10,000
Area Density	1,000
Population Density	10,000
Area Density	1,000

Today's global issue, the Covid-19 pandemic, has exacerbated the problems we face in the crowded streets of Istanbul. The pandemic, which restricts our movements and forces us to stay close to home, has greatly limited our outdoor spaces in the city. As a result, a project to redesign Barbaros Hayrettin Pasha Square has been created to address the key issues of limited space, unsafe areas, and the lack of sufficient open areas. The systematic linear design uses specific units but remains open to different textures at intersections. Starting at the intersection of Barbaros Boulevard and Beşiktaş Avenue, the lines that lead to the pier focus primarily on the individual, helping them navigate easily through the space amidst the confusion.

Roof-tance

Zeynep Berfu Yılmaz

“Roof-tance” was produced within the scope of Landscape Design 1 carried out by Dr. Meliz Akyol and Res. Assist. Elif Serdar Yakut under the title “Human” in the spring semester of 2019-2020.

In this project, the roofs of the Büyük Beşiktaş Bazaar (2555 m²), Sinanpaşa Passage (1782 m²), and Akaretler Parking Lot (1500 m²), which are publicly accessible,

were redesigned. The terrace of the Büyük Beşiktaş Bazaar was designed as a festival, resting, and viewing area, as it offers a great vantage point. It also serves as a response to

the lack of festivals and activities in Beşiktaş. The roof of the Sinanpaşa Business Center was transformed into a space for shopping, dining, and drinking.

Increasing the green areas of Beşiktaş Square, which is currently lacking in green space, will help reduce street density and provide new spaces for people. In this project, the roofs of the Büyük Beşiktaş Bazaar (2555 m²), Sinanpaşa Passage (1782 m²), and Akaretler Parking Lot (1500 m²), all publicly accessible areas in Beşiktaş, were redesigned. The terrace of the Büyük Beşiktaş Bazaar was designed as a festival, resting, and viewing area, taking advantage of its great vantage point and addressing the lack of festivals and activities in Beşiktaş. The roof of the Sinanpaşa Business Center was organized as a space for shopping, dining, and drinking. The roof of the Akaretler Parking Lot, located in the residential area of Akaretler, was designed to offer a sports field for the community. When planting on the roofs, species suitable for rooftop growth, not exceeding 10 meters in height and able to thrive in planters, were selected. These include Chamaecyparis lawsoniana, Acer palmatum, Picea glauca, and Genista lydia.

*Akaretler Car Park
-Sports facility
for people living here

*Sinanpaşa Passage
- food hall, shopping

*Buyuk Besiktas Çarşısı
-festivals, activities
scenery point resting

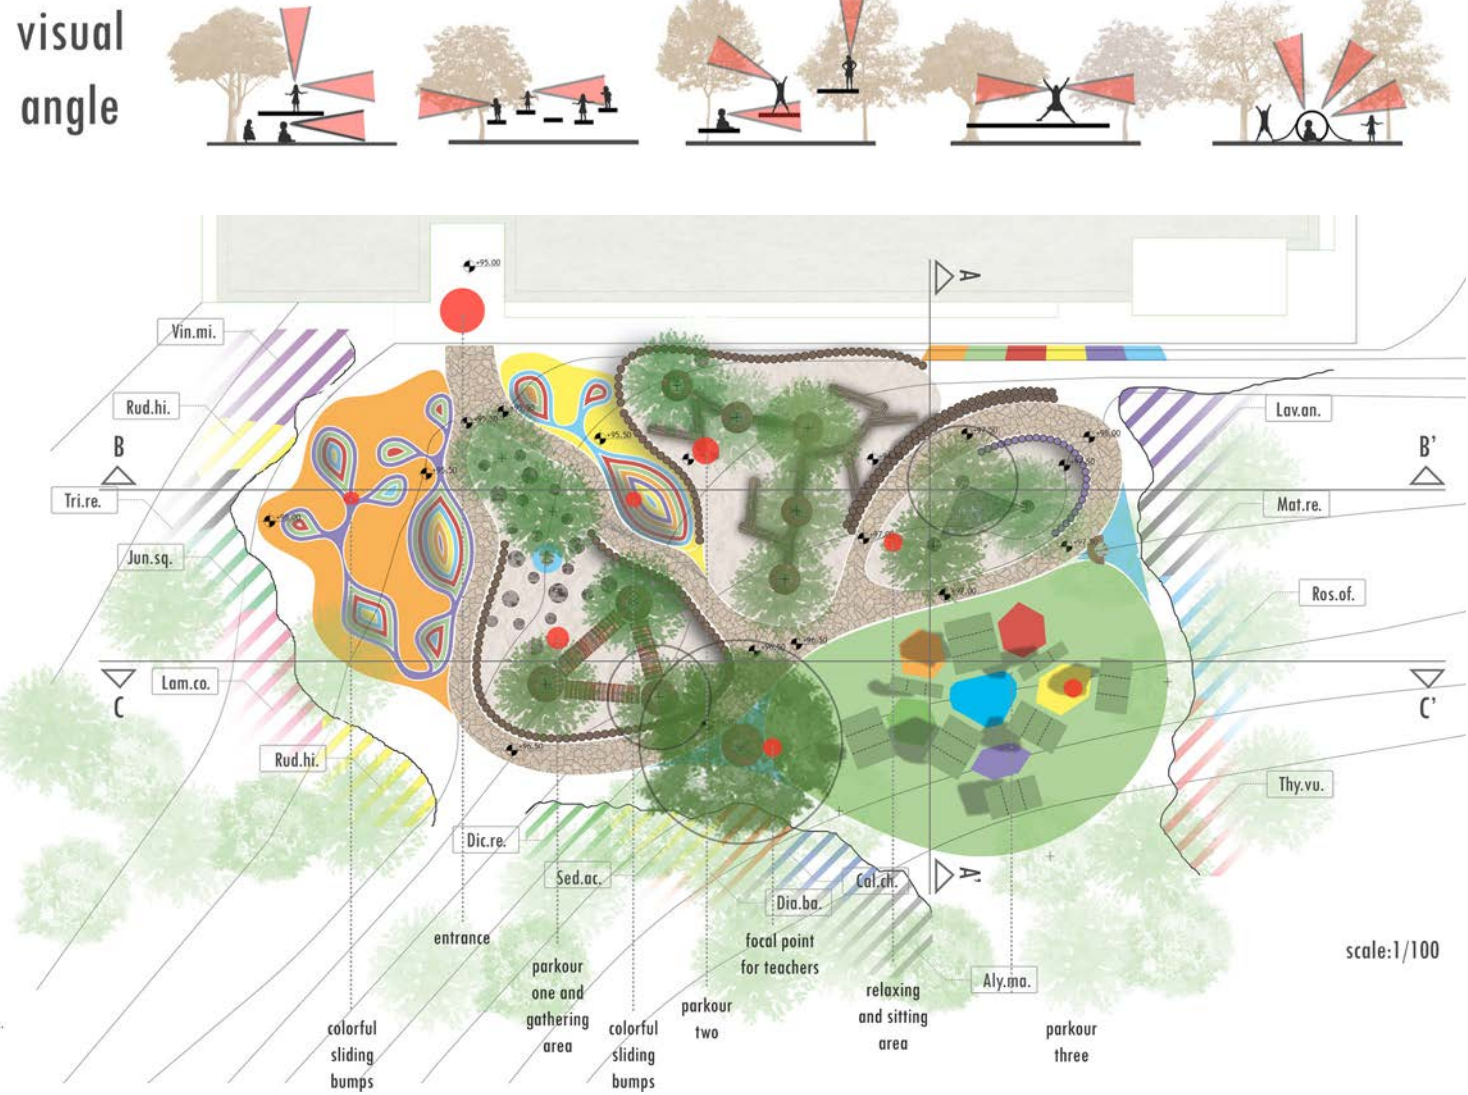

Parkour Through Woods

Kübranur Akkabak

“Parkour Through Woods” was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Fatma Ayçim Türer Başkaya, MSc. Maya Türkmen Numan and Res. Assist. Nergis Aşar under the title “Dream Big” in the spring semester of 2019-2020.

The project focuses on children, and the study area is the ITU Maslak Kindergarten. While the Maslak campus is a vibrant social hub, this kindergarten is isolated, hidden from view, and set in a very natural environment. Additionally, there is a need for privacy and safety for the children. The study area is located behind the main kindergarten, and it lacks structural elements. Therefore, the goal was to design a new playground that remains natural while ensuring safety for the children. Given the age range of the children, from two to six years old, safety is a top priority in this design.

section A-A'

section B-B'

section C-C'

In this design proposal, the creation of various zones and parkour areas for the children's physical activities aims to provide them with diverse experiences. Different elevations, based on the topography of the study area, and the addition of artificial colored mounds offer unique visual perspectives and experiences for the children. Areas created with tree logs, placed between the existing trees in the study area, will give the children a sense of being in a natural woodland or forest. Tubes, positioned at ground level, will offer various experiences, such as looking through holes in the tubes and providing hiding spots for the younger children. A hammock area will serve as a relaxing space for the children after their running and other activities.

In addition to this design, potential observation points were identified for teachers to monitor the children. Finally, to preserve the natural feel of the area and to complement the existing large trees, the planting design consists of knee-high groundcovers. Aromatic plants, such as lavender and thyme, are placed along Istanbul's prevailing northeast wind direction. Other surrounding groundcovers include spring and autumn-blooming plants to create visual beauty and boundaries, helping to guide the children and prevent them from leaving the playground area. Although there are teachers assigned to each class, the surrounding plants will make it easier for teachers to keep an eye on the children, considering the presence of sixty to seventy little ones.

Play-Universal-Ground

İrem Nur Yener

"Play-Universal-Ground" was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Fatma Ayçim Türer Başkaya, MSc. Maya Türkmen Numan and Res. Assist. Nergis Aşar under the title "Dream Big" in the spring semester of 2019-2020.

This area is one that is closely connected to nature, with topographic variations, and has never been designed before. I decided to develop a concept for the playground that allows children to experience the most prominent features of the planets and the Sun in the Solar System.

Playgrounds compatible with topography

Wind/Sound/Experience

Different cavities/ Hiding

Independent/Special/Small Group meetings

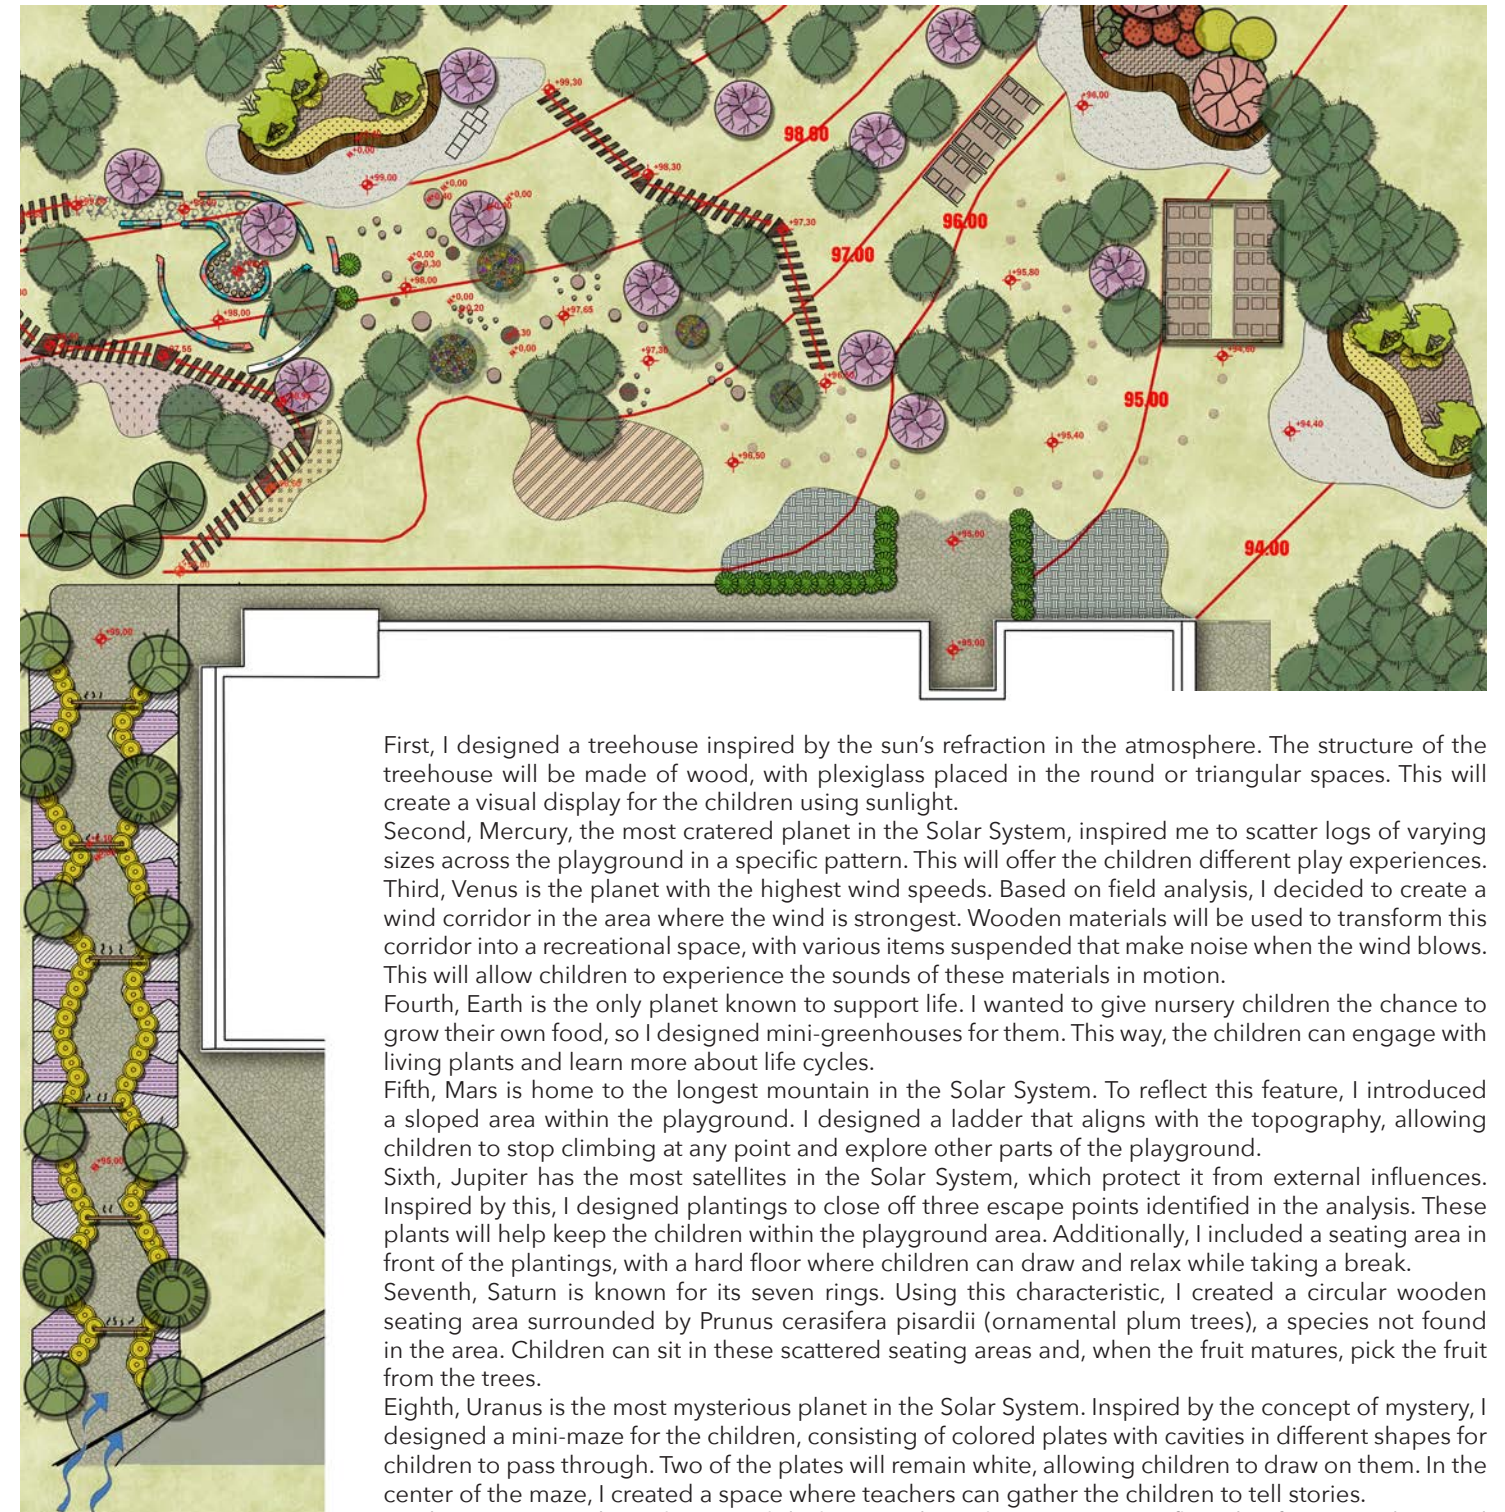

Increasing farming skills

Painting/Drawing Skills

2019-2020 Spring

First, I designed a treehouse inspired by the sun's refraction in the atmosphere. The structure of the treehouse will be made of wood, with plexiglass placed in the round or triangular spaces. This will create a visual display for the children using sunlight.

Second, Mercury, the most cratered planet in the Solar System, inspired me to scatter logs of varying sizes across the playground in a specific pattern. This will offer the children different play experiences. Third, Venus is the planet with the highest wind speeds. Based on field analysis, I decided to create a wind corridor in the area where the wind is strongest. Wooden materials will be used to transform this corridor into a recreational space, with various items suspended that make noise when the wind blows. This will allow children to experience the sounds of these materials in motion.

Fourth, Earth is the only planet known to support life. I wanted to give nursery children the chance to grow their own food, so I designed mini-greenhouses for them. This way, the children can engage with living plants and learn more about life cycles.

Fifth, Mars is home to the longest mountain in the Solar System. To reflect this feature, I introduced a sloped area within the playground. I designed a ladder that aligns with the topography, allowing children to stop climbing at any point and explore other parts of the playground.

Sixth, Jupiter has the most satellites in the Solar System, which protect it from external influences. Inspired by this, I designed plantings to close off three escape points identified in the analysis. These plants will help keep the children within the playground area. Additionally, I included a seating area in front of the plantings, with a hard floor where children can draw and relax while taking a break.

Seventh, Saturn is known for its seven rings. Using this characteristic, I created a circular wooden seating area surrounded by *Prunus cerasifera pisardii* (ornamental plum trees), a species not found in the area. Children can sit in these scattered seating areas and, when the fruit matures, pick the fruit from the trees.

Eighth, Uranus is the most mysterious planet in the Solar System. Inspired by the concept of mystery, I designed a mini-maze for the children, consisting of colored plates with cavities in different shapes for children to pass through. Two of the plates will remain white, allowing children to draw on them. In the center of the maze, I created a space where teachers can gather the children to tell stories.

Ninth, Neptune is the only non-solid planet in the Solar System. To reflect this feature, I designed various surface types throughout the playground for the children to explore.

These nine elements are connected throughout the design, offering a cohesive and engaging experience for the children.

LD I / Dream Big

78

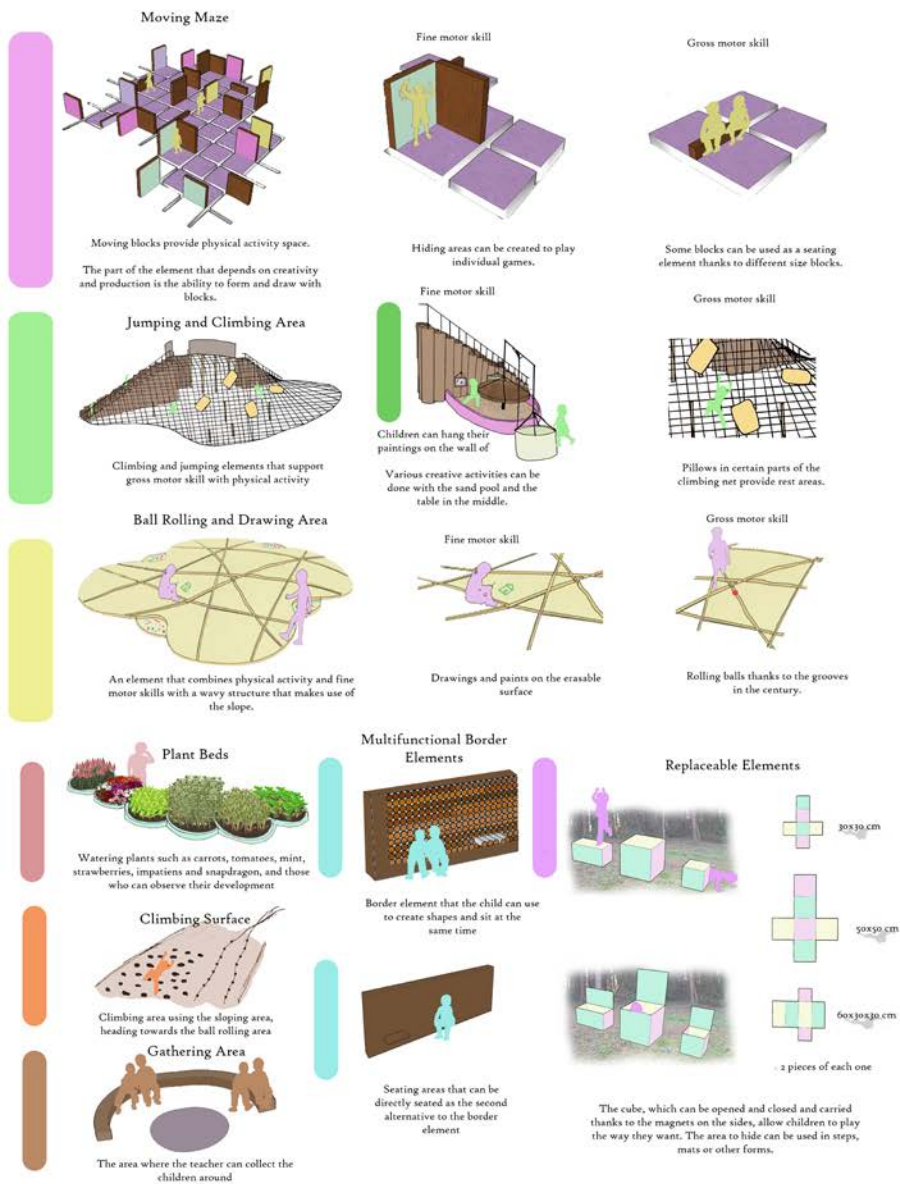

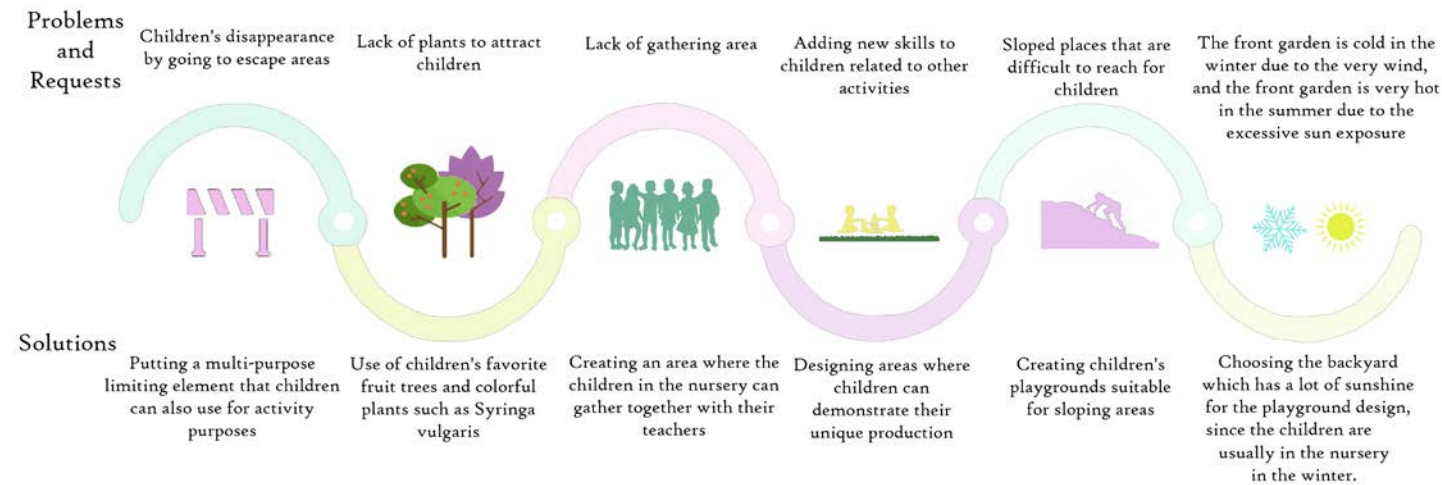

Cre-Activity / Prod-Activity

Melisa Albayrak

"Cre-Activity/ Prod-Activity was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Fatma Ayçim Türer Başkaya, MSc. Maya Türkmen Numan and Res. Assist. Nergis Aşar under the title "Dream Big" in the spring semester of 2019-2020.

I focused on the development of both fine and gross motor skills, which play an important role in childhood development. The areas I designed include spaces specifically intended to enhance these two skills in different ways. A child can develop their gross motor skills through physical activities, while also strengthening their fine motor skills by using creativity and engaging in productive tasks. The name of the project reflects this interconnected system.

The first playground area is a labyrinth made up of blocks in different colors and heights. It is located closest to the nursery entrance because it is safer and well-suited for children aged 2 and 3. In this moving maze, children can play games by pushing the blocks and hiding. Using their creativity, they can draw shapes on the blocks or create their own shapes by rearranging them. The blocks can be pushed thanks to a rail system, making it easy for young children to use. This feature, along with its proximity to the entrance, makes it an ideal location for this area.

In the climbing and jumping area, activities such as climbing support physical development. The sand pool next to this area and the table in the middle allow children to explore different shapes. This is achieved by placing weight-bearing materials (such as cones or children's items) in a basket next to the system that enables the table to move up and down, or by removing the items from the basket. The ball rolling area features a wavy surface, allowing children to roll balls and manipulate them to create different movements. There are two ball rolling grooves for two different ball sizes (6 cm and 12 cm). Since the surface is made of flipchart material, children can easily draw and erase pictures. This drawing area helps develop fine motor skills. Children can reach this area by stepping on the stepping stones or using the climbing elements on the sloping surface next to it. Another area that encourages creativity is the plant beds. Here, children can water and harvest fruits and vegetables from plants like Antirrhinum majus, Impatiens walleriana, Mentha piperita, Solanum lycopersicum, Fragaria vesca, and Daucus carota. These plants are suitable for children to grow, and the flowering plants are especially appealing to them. To ensure children are not lost or wander off, I designed fun fence elements to keep them safely within the playground.

Seasonal Changes of Plants

Winter

Evergreen Plants

- Pinus nigra (Pin. ni.)
- Cedrus libani (Ced. li.)
- Laurus nobilis (Lau. no.)
- Prunus laurocerasus (Pru. la.)
- Citrus sinensis (Cit. si.)
- Citrus limonum (Cit. li.)
- Hedera helix (Hed. he.)
- Thymus vulgaris (Thy. vu.)
- Trifolium repens (Tri. re.)
- Campanula carpatica (Cam. ca.)
- Antirrhinum majus (Ant. ma.)
- Impatiens walleriana (Imp. wa.)
- Mentha piperita (Men. pi.)
- Daucus carota (Dau. ca.)
- Fragaria vesca (Fra. ve.)
- Eucrymus japonica
- 'Aurea' (Euc. ja. A.)

- Prunus laurocerasus (Pru. la.)
- Acer campestre (Ace. ca.)
- Hedera helix (Hed. he.)
- Campanula carpatica (Cam. ca.)
- Cornus alba (Cor. al.)
- Impatiens walleriana (Imp. wa.)
- Solanum lycopersicum (Sol. ly.)
- Daucus carota (Dau. ca.)
- Fragaria vesca (Fra. ve.)

Autumn

Remarkable Plants

- Citrus sinensis (Cit. si.)
- Prunus laurocerasus (Pru. la.)
- Acer campestre (Ace. ca.)
- Cornus alba (Cor. al.)
- Aster amellus (Aster. am.)
- Campanula carpatica (Cam. ca.)
- Antirrhinum majus (Ant. ma.)
- Impatiens walleriana (Imp. wa.)
- Solanum lycopersicum (Sol. ly.)

In the first example of this multi-purpose fence element, the wooden rollers allow the child to create different shapes or use the area as a sitting space by adjusting its length. In the second example, there are pull-out seating elements for children who wish to sit directly.

The design also includes a gathering area where the teacher can bring the children together. This half-moon-shaped gathering area, with a mat in the center, facilitates communication between students and teachers.

The movable cube in the playground, which is not a fixed element, can be opened and closed using magnets on the sides. Children can use it to set up games, allowing for both individual and group activities.

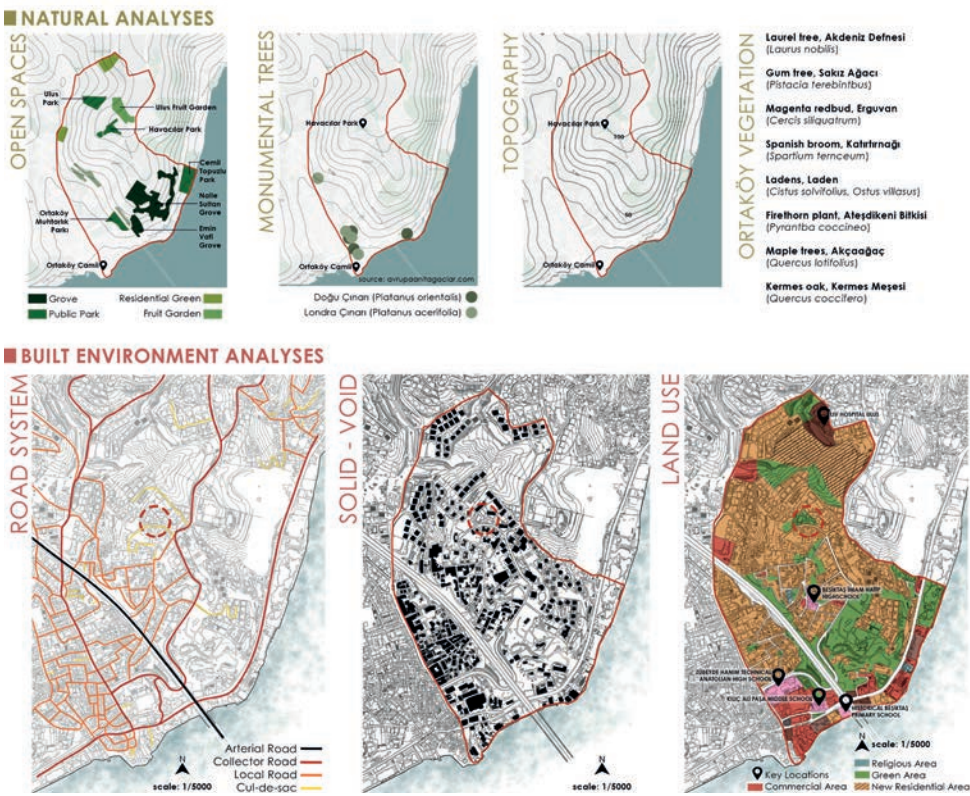

In the planting design, I incorporated *Prunus domestica*, *Citrus sinensis*, and *Citrus limonum* fruit trees, along with plants designed to capture children's attention. *Syringa vulgaris*, known for its vibrant color, is one of the plants in the playground. Additionally, *Thymus vulgaris*, *Campanula carpatica*, and *Trifolium repens* groundcovers, which surround the three main playground areas, provide children with easy movement due to the gaps between them. *Cornus alba*, with its striking color, and *Aster amellus*, which attracts butterflies, are also included. *Hedera helix* was planted in key areas to prevent children from escaping or getting lost. Finally, *Acer campestre*, with its brownish-yellow falling leaves, was chosen to attract children's attention and enhance the playground experience.

Timeline Park

Hande Beril Küçükler

“Timeline Park” was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Fatma Ayçim Türer Başkaya and Res. Assist. Başak Akarsu under the title “Responding to the Future” in the spring semester of 2020-2021.

The landscape design project, carried out in collaboration with studios throughout the semester, aimed to examine the landscape layers based on the historical context of the Bosphorus. At the same time, these landscape layers were considered within a socio-economic system, which was then integrated with a technological approach at the conclusion of the project. As part of the project, various field analyses were conducted, moving from general to specific. The analysis began with the history and development of the Bosphorus and was then focused on the project area, Ortaköy. Based on this concept, a new design was developed for the project area, culminating in a planting design.

Site analyses were conducted to better understand the characteristics of the area. The purpose of these analyses is to develop sustainable designs that are compatible with the site. In this context, the site's characteristics were examined under various headings. The project area, chosen by narrowing from general to specific, is Ortaköy. Analyses were performed for the Ortaköy area.

Route Accessibility & Problems

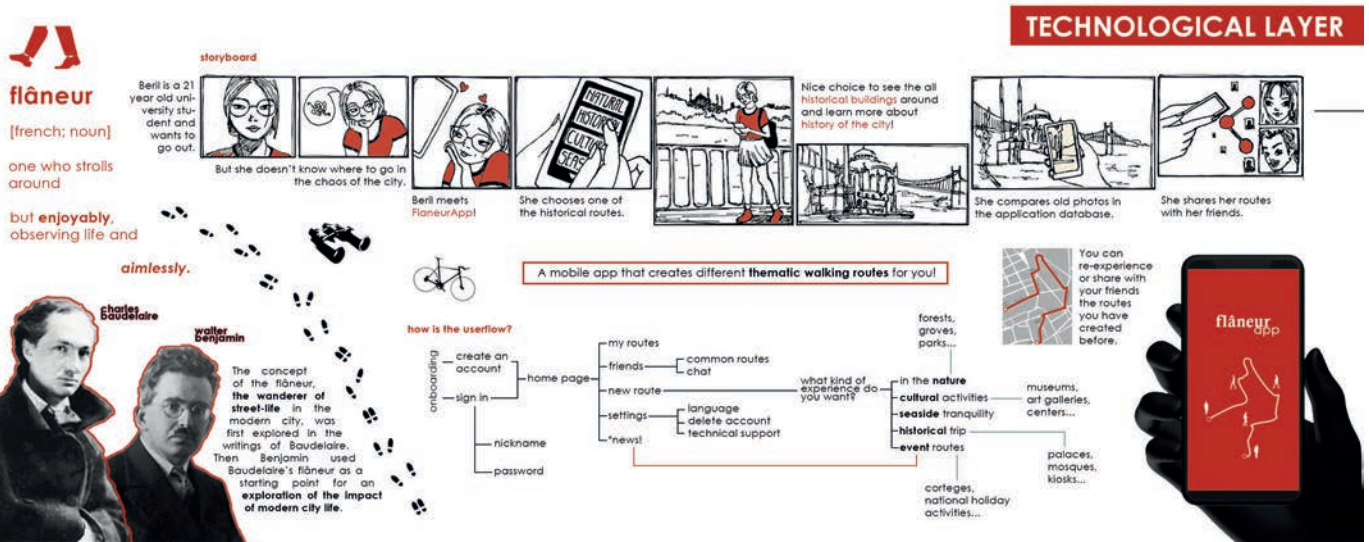

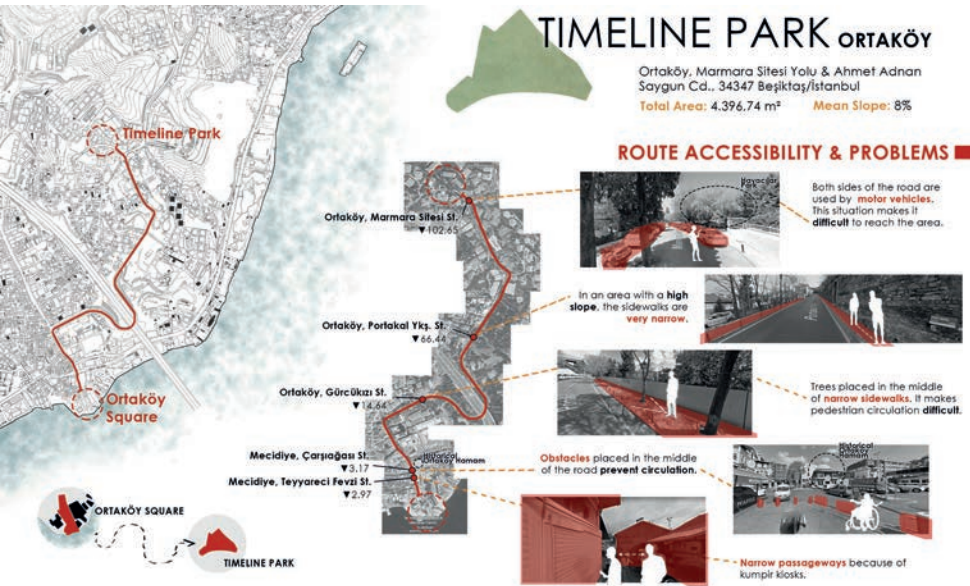

The obstacles faced by those wishing to access Havacılar Park from Ortaköy Square provide insights into the park's accessibility. This route faces issues such as narrow sidewalks, barriers, and a lack of parking.

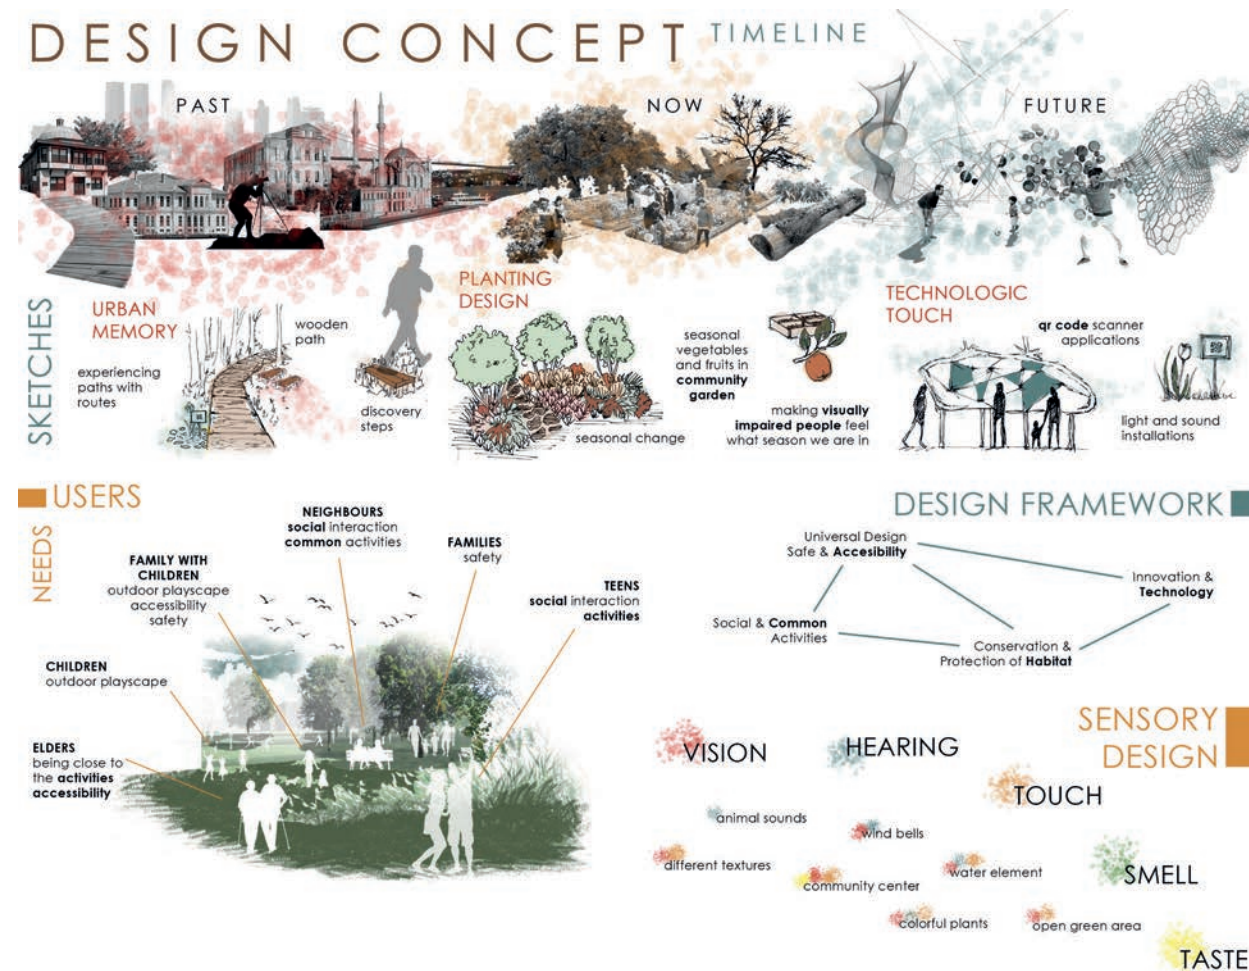

Microclimatic Features

At this stage of the project, the microclimatic characteristics of the area were examined. The findings are as follows: The area receives sunlight almost throughout the day, and there is a wind corridor within the space. To better understand these conditions, the sun and wind patterns were examined at specific times and expressed diagrammatically.

Current Usage of the Area

Currently, Havacılar Park includes basketball courts, sports equipment, seating areas, and a playground. The area functions as a neighborhood park, but based on the analyses conducted, it has been determined that the existing park functions are insufficient.

86

CONCEPTUAL APPROACH

In this approach, predictions were made about the future use of the area, and these scenarios were examined under different headings.

a. Users:

The first heading is the user profile. Currently, the park functions as a neighborhood park, meaning its users are quite diverse. To ensure an effective experience for the future users of the park, the needs of these users were thoroughly examined.

b. Design Framework:

Since the concept is intended to appeal to a wide range of users, organizing the needs of these users under various categories makes the design concept more understandable. The concept and the users' expectations form the foundation of the design. The design focuses on four key areas: universal design, innovation and technology, habitat conservation and protection, and social & communal activities.

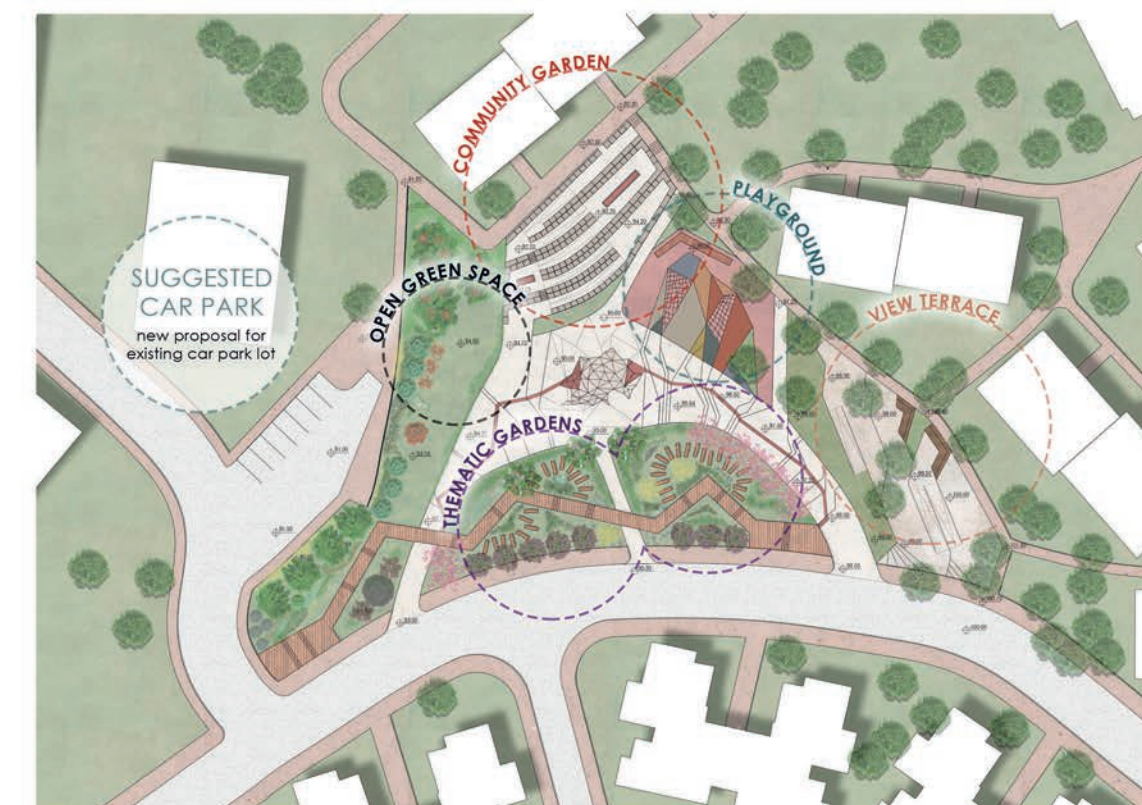

c. Sensory Design Approach:

Within the framework of this design, the park's functions were developed according to sensory design principles. This approach aims to provide a more lasting and unique experience for users of the newly designed park.

d. Layers of Concept:

The new design concept, which addresses the issues in the area and enhances its positive aspects, is the "Timeline" concept. The Timeline consists of three time layers: past, present, and future. The past layer emphasizes Ortaköy's urban memory, using a wooden path as a historical metaphor. The present layer aims to convey time through landscape elements, while the future layer introduces various installations, incorporating a technological touch.

TIMELINE PARK 1/200 DESIGN PLAN ▲N

87

FUNCTIONS

1. CENTER

2. COMMUNITY GARDEN

3. PLAYGROUND

4. VIEW TERRACE

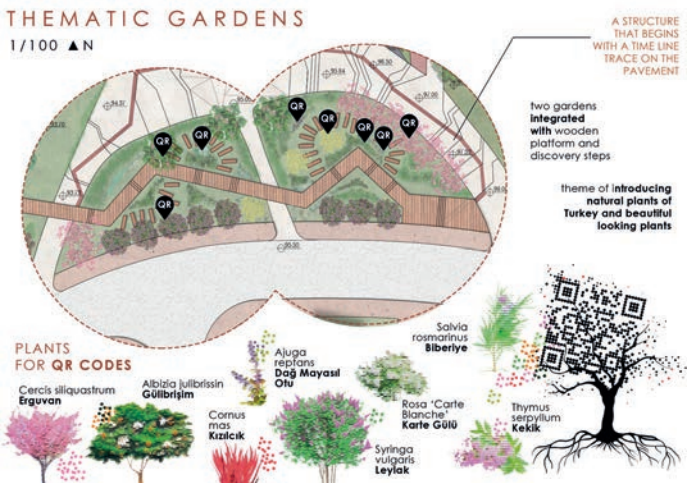

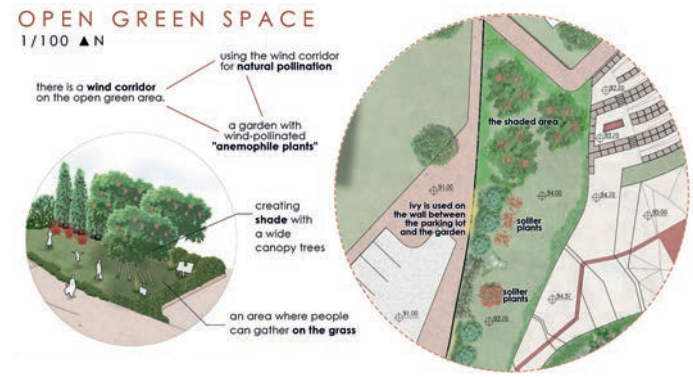

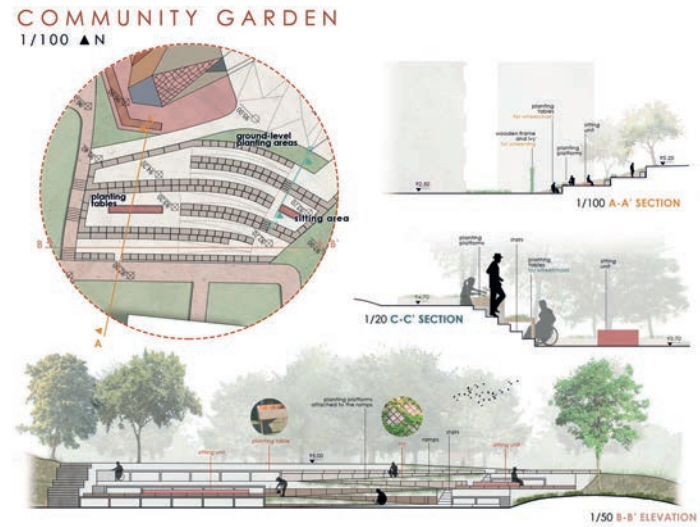

5. THEMATIC GARDENS

6. OPEN GREEN SPACE

DESIGN APPROACH

Based on all the analyses and ideas, different areas were created within the park. For instance, users will have the opportunity to grow their own fruits and vegetables in the garden. The open green space creates an environment where people can listen to birdsong and connect with the earth. It offers a more natural experience for children at play. The view terrace provides the best panoramic view, in line with the site's topography. Lastly, thematic gardens allow people to feel the passage of the seasons through their landscape designs. The wooden path leads visitors into the past layer, while offering an insight into the future layer, allowing people to learn about plants through applications like QR codes.

a. Community Garden:
The communal garden allows people to grow their own plants, vegetables, and fruits, fostering a different form of communication between neighbors. This space also helps people experience the passage of time without needing a clock or calendar, as the seasonal changes of the plants raise awareness of time.

b. Playground:
The playground provides children with a natural play experience. Platforms, climbing areas, and climbing nets have been integrated into the sloping park terrain.

c. View Terrace:
Located at the highest point of the park, the view terrace offers a vantage point from which visitors can observe the vegetation and structures of the park. It provides a comprehensive perspective of the entire timeline concept.

d. Open Green Space:
Designed as a relaxing area for people to sit and unwind, the open green space is also crucial for protecting the local habitat. The existing wind corridor in this area has been positively utilized and complemented with wind-pollinated plants.

e. Thematic Garden:
Thematic gardens introduce a technological element to the park's landscape. Through QR code technology, these gardens introduce visitors to the natural beauty of Turkey's plants. A wooden platform runs through the thematic gardens, connecting them, while discovery steps guide users to plants with QR codes for further exploration.

f. Center:
The concept of the thematic garden merges with the central structure, which contains various seating areas and digital screens. These screens display the transformation of data received from QR codes, which are processed through artificial intelligence technology and converted into visual works of art.

seasons and growing plants

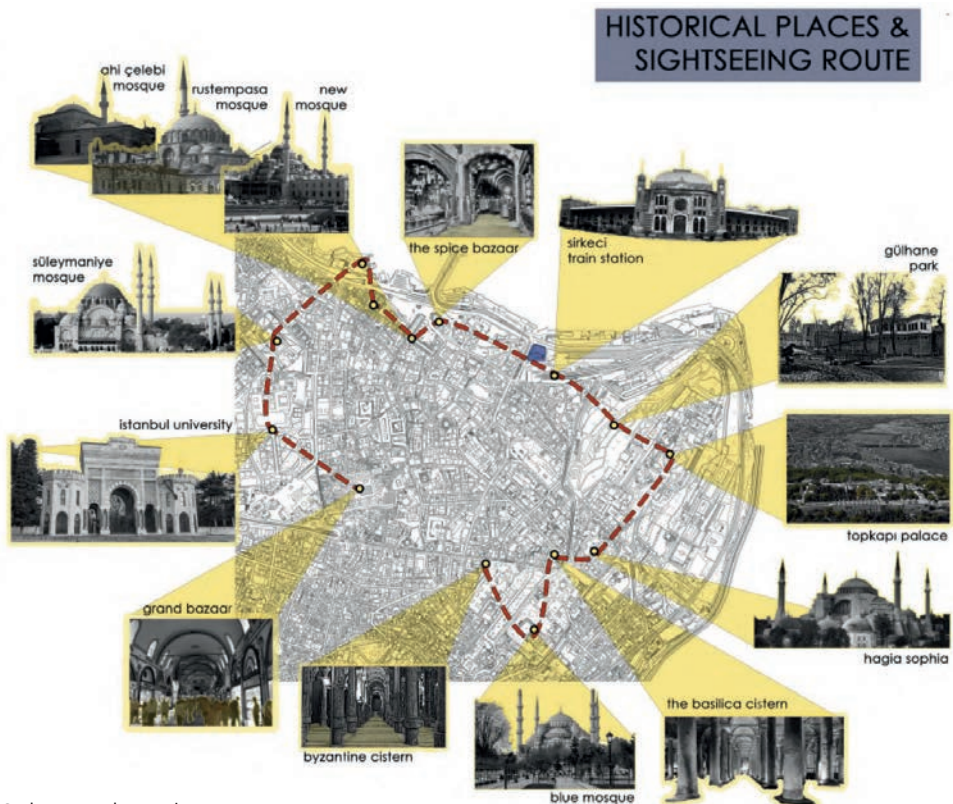

ON History Park

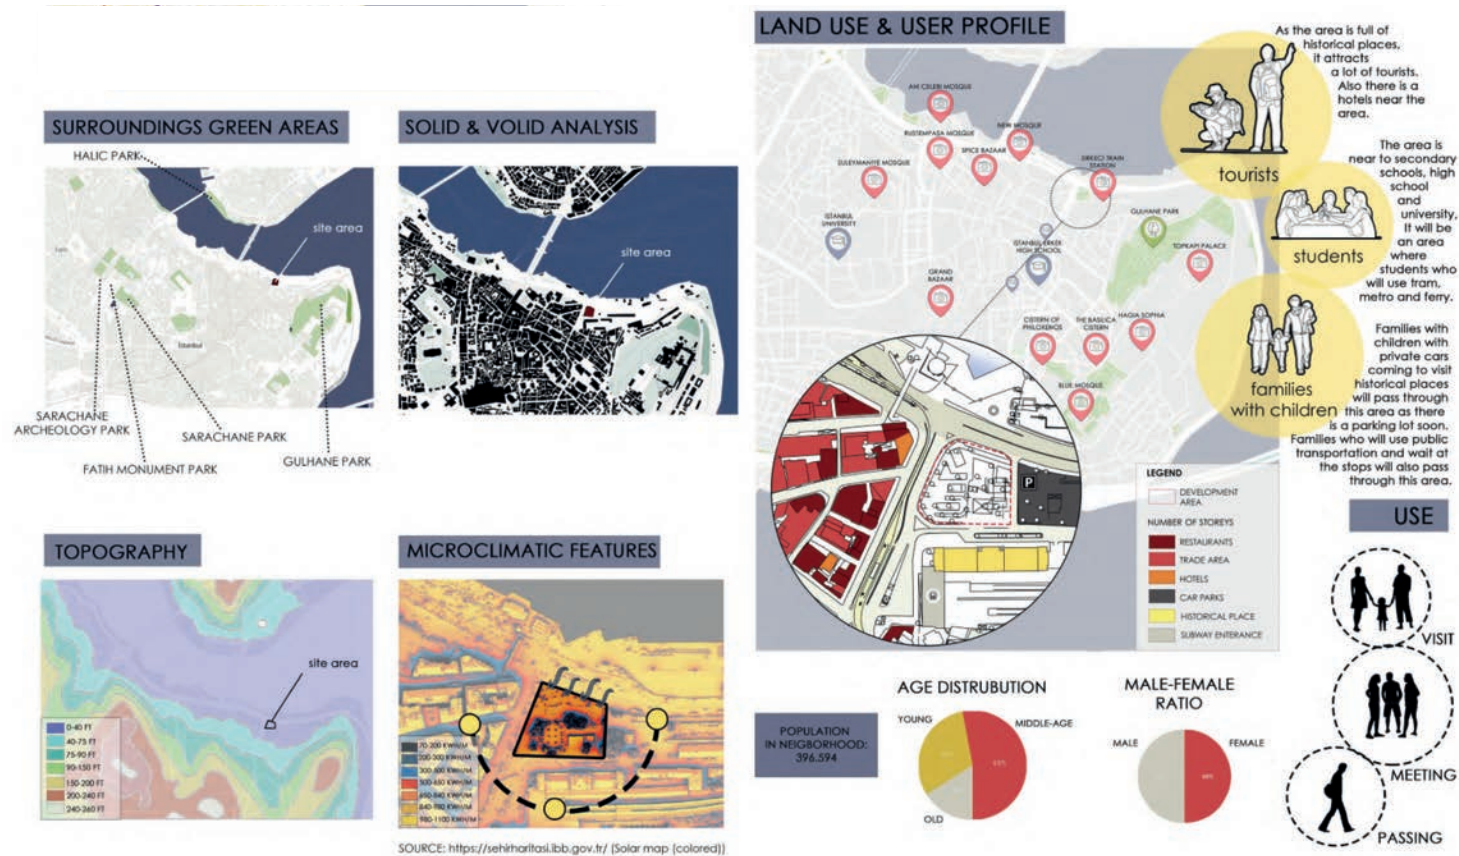

Esra Solmaz

“ON History Park” was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Fatma Ayçim Türer Başkaya and Res. Assist. Başak Akarsu under the title “Responding to the Future” in the spring semester of 2020-2021.

Fatih, one of Istanbul’s oldest settlements on the historical peninsula, is home to significant landmarks, including historical mosques, underground cisterns, and bazaars. The project site is located in the Sirkeci district of Fatih, covering an area of 4,300 square meters. The area is easily accessible via multiple transportation options. It is just two minutes away from the ferry ports and tram lines to Beşiktaş, Kadıköy, Üsküdar, and Harem, and five minutes from the Marmaray metro line. This central location provides a distinct advantage in attracting a diverse range of users to the area. While designing, the needs and preferences of these users were carefully considered. Pedestrian circulation was prioritized, and functions such as vegetation coverage, noise control from vehicles, and providing shade were incorporated. The plant combinations selected are intended to create different color palettes throughout the changing seasons.

While designing the park in this historic district of Istanbul, the concept focused on exploring the underground history of the city. Historical structures dating back to Byzantine times have been destroyed by wars and invasions, leaving behind a landscape rich in underground history, shaped by many civilizations. The technological layer incorporated into the park will visualize this underground world, making it the central theme of the design. Through the use of holograms, visitors will be able to experience Istanbul’s subterranean history. The windowed structures integrated into the playgrounds and thematic gardens will evoke historical memories for both adults and children. The park’s elevated buildings, including thematic gardens, amphitheater seating areas, and playgrounds, aim to provide visitors with a sense of vertical movement—feeling both higher and lower as they explore the space. Additionally, seating areas shaped like water curves, along with blue lighting in the thematic gardens, represent the element of water, further enhancing the park’s immersive experience.

Sirkeci Park Analysis

a) Existing Plant Species
Sirkeci Park is home to a variety of plant species, including both younger trees and older, well-established ones. Among the trees in the park, the most deeply rooted specimens were selected for preservation, and the design has been developed with these trees in mind. Notable tree species in the park include *Platanus orientalis*, *Magnolia grandiflora*, *Prunus cerasifera*, *Juglans regia*, *Laurus nobilis*, and *Sophora japonica pendula*.

b) Problems
Several deficiencies have been identified in the park’s current use, particularly with regard to its user profile. For example, despite the presence of nearby restaurants and cafes, the park lacks seating areas equipped with tables for those who wish to eat outdoors. Additionally, there is no designated space for children’s play activities. The park also lacks provisions for street performers and events, and the park entrances are not properly connected with pedestrian crossings, impeding smooth pedestrian circulation.

92

93

Project Decisions

a. User Profile:

The primary users of the park include tourists and families with children, due to its proximity to historical landmarks. Additionally, students from nearby schools, including a university, high school, and primary school, are considered key users. Local residents, based on demographic factors, are also an important user group.

b. Functions:

To ensure smooth pedestrian circulation, the pathways are interconnected with pedestrian crossings. After analyzing the needs of the user profile—such as seating areas, landscape viewing spaces, performance areas, children’s playgrounds, and thematic gardens—the functions were determined based on environmental considerations, including sunlight and wind direction.

c. Design Principles:

The design adheres to several key principles:

- Historical Visual and Sensory Memory
- Sustainable Nature
- Sense of Community
- Technological Integration
- Physical Wellbeing

d. Technology Layer:

In the elevated thematic gardens, various plant species are incorporated, with glazed structures that give the impression of viewing the underground. This feature serves as a hologram, showcasing the historical traces of the site, which are digitally rendered by the designer.

materials:

- stone

Kadıköy Coastal Band | 2031

İrem Karabulutlu, Almira Endican, Alperen Atmaca

"Kadıköy Coastal Band | 2031" was produced within the scope of Landscape Design 1 carried out by Assist. Prof. Ikhwan Kim and Res. Assist. Nergis Aşar under the title "Transformative Spaces" in the spring semester of 2020-2021.

Equipment was added to the design to help cats, dogs and birds meet their basic needs, spaces were designed for conservatory students to relax during their breaks and take their lessons outdoors, areas were added for people watching the theater or waiting for the bus.

We added ramps where it is necessary, sitting areas were placed for the elderly, children or disabled people to rest at least every thirty meters, and flooring for visually impaired people was added to the entire area.

It was very important for us because of the density and importance of the area that every living thing's right to live is one of the prominent principles of this design. There were no designs that appealed to each of the human types found in the area, and either the plants or animals living in the area were not considered sufficiently.

How?

Equal

Design Goals

How?

Accessibility

Why? In design, it was one of our priorities to be usable and experienceable, that is, accessible for everyone. It has been decided that it is not appropriate in public space and square designs to create spaces that cannot be used by every living thing in an area that is open to all kinds of people and is so dense.

Ecological

How?

There is a continuous green corridor line above and below the Kadıköy square. This green corridor is divided in Kadıköy Square. Connecting the upper and lower green corridors was a prominent element in the design, as we know the continuity of the greenways and their ecological importance to our planet. At the same time, Kadıköy was a rich area in terms of plant species in the past, but with urbanization, we started to see these endemic species less and less. Bringing these plant species back to Kadıköy and strengthening the ecology of the region has been one of our priorities.

AniPark

Tuğba Kurt

“AniPark” was produced within the scope of Landscape Design 1 carried out by Selen Aksoy, MSc. and Res. Assist. Nergis Aşar under the title “PublicScape” in the spring semester of 2020-2021.

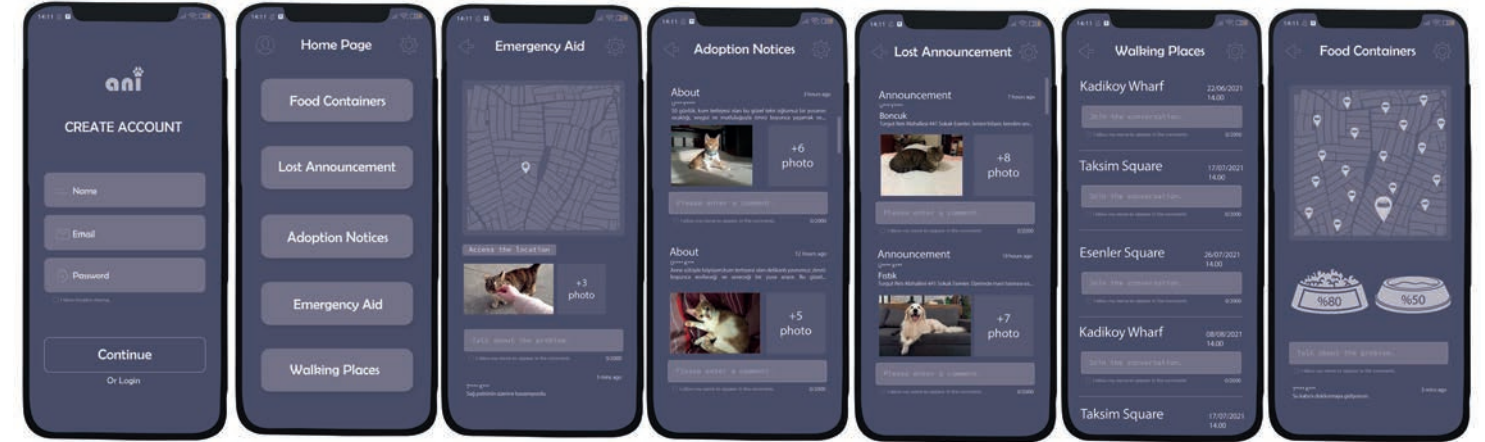

Synthesis

With the Anipark app, you will be able to see the animals in need of help around the park, check the status of the feeding points, follow the losat and appropriation notices, and access the locations and dates of the walks. In addition, you will be able to instantly informed of these situations with the hologram signs in the park.

By accumulating rain water under the park, the energy needed by the park will be met from here. Thus, it will be a self-sufficient park, without the need for extra energy.

Informing people with hologram signs.

Safety Route and New Use of The Park

"When there are people present in a public space such as city streets, it strengthens the space and inspires social cohesion." - Jane Jacobs

So it is necessary to increase the density of people on the streets. Being able to attract more people to the park creates a safer route. Therefore, thanks to the flexible design that all users can use, the number of daily visitors of park will increase.

The safe route is a natural route formed by the density of people around this park because it is among the points that have the potential to attract users. In addition to mosques, primary schools and commercial spaces, nooks and crannies are being recycled and turned into community gardens, and the use of streets is increasing.

The new use of this park was designed to keep the streets alive. Residents can book the designated areas of this park on the day and time they want, giving their own events and inviting their neighbors. It will strengthen neighborly relations, and the streets will remain alive. In this way, safer streets will be created.

Golden Horn

Dilara Kılıç

"Golden Horn" was produced within the scope of Landscape Design 1 carried out by Dr. Meliz Akyol and Res. Assist. Başak Akarsu under the title "Social Ecology & Ethics" in the spring semester of 2021-2022.

URBAN OF SOCIETY - GOLDEN HORN

The coastline of the Golden Horn, which is an important part of Istanbul, has continued its development by hosting various functions since the foundation of the city, especially since the 19th century, it has followed a completely different direction from its development until

Combination of urban and rural

SPATIAL MEMORY

During these periods, in addition to the physical and functional development of the shores of the Golden Horn, the trade, industry and agricultural activities here also affected the silhouette and socio-cultural structure of the Golden Horn.

The greening of the Golden Horn remained in a limited area, did not contribute to the preservation of the historical texture, and even caused the loss of some historical structures during the demolitions.

Beginning of human cultivation of agricultural lands = Experience

CONSCIOUS PRODUCTION

ECONOMIC PROSPERITY

LIVABLE ENVIRONMENT

URBAN AGRICULTURE

CONSCIOUS CONSUMPTION

LOCATION

The industrialization process, which has been ongoing since the 19th century, along with urban planning studies, has severely impacted the urban transformation of the Golden Horn. Although the Golden Horn is one of the key tourist destinations in Istanbul today, it has lost its identity over time and is losing its value due to improper development. In this context, the Golden Horn should regain its former vitality and renew its historical memory. As the meeting point of cultural diversity and the primary hub of social life, cities are an integral part of the collective memory. For

this reason, urban memory has become an important area of study in social history, particularly over the last century. The relationship between urban memory and space is enriched by individuals' perceptions of urban space and their differences. Istanbul, with its socio-cultural structure, can be considered the primary place of life. The aim is to unite the fragmented social structure, support the city's economy, and, at the same time, revive the memory of the place by reintroducing commercial activities from the Ottoman period.

In this context, urban agriculture will play both a unifying and preservative role in maintaining the historical significance of the area. Once a place of intense agricultural and social activity, the Golden Horn is now more tourist-oriented. The introduction of a pottery section here will help continue old traditions while offering a shared activity for both locals and tourists.

In this area, where agriculture and gardens are located, the market

section will promote the area as a marketplace, supporting the local economy and showcasing the products grown there to the public. Farmland will remain to encourage people to farm and to help revive the memory of the place. This garden, which will increase the permeable surface of the Golden Horn, will contribute economically while also fostering socialization.

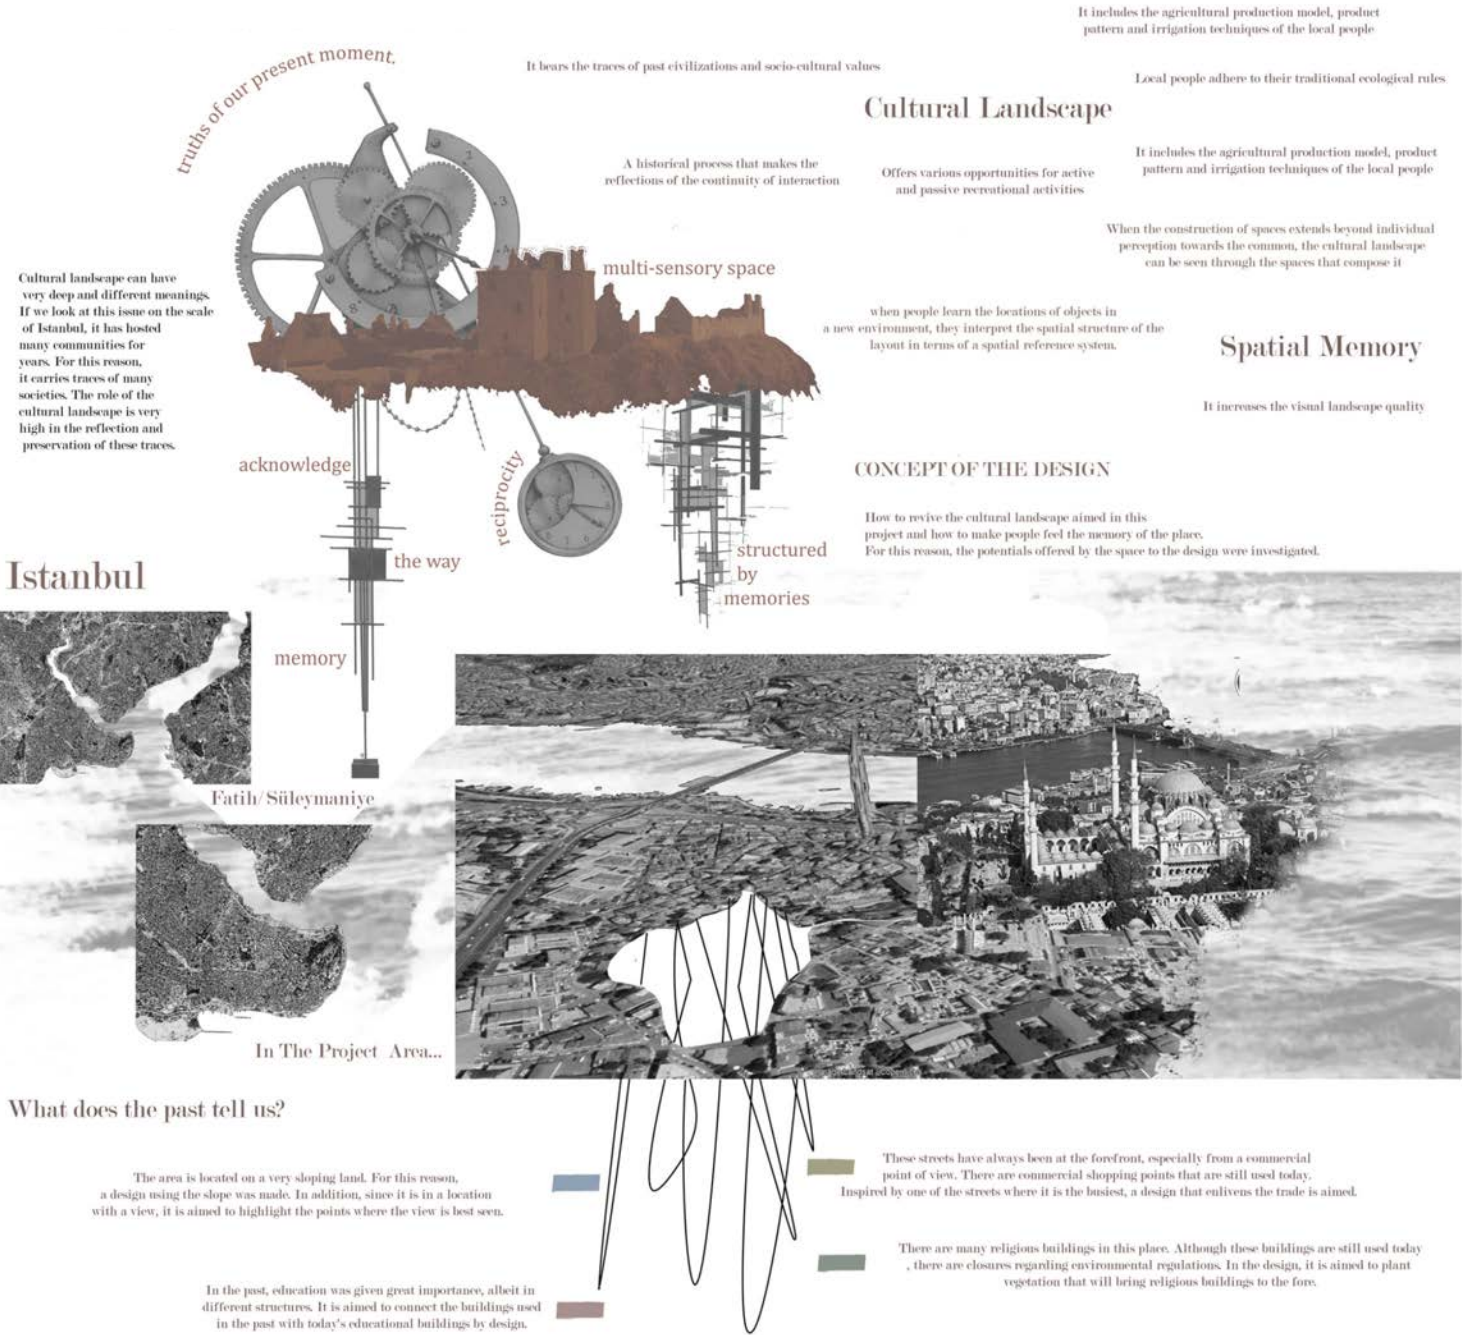

Traces of Time

Meryem Gülbahar Okan

“Traces of Time” was produced within the scope of Landscape Design 1 carried out by Dr. Meliz Akyol and Res. Assist. Başak Akarsu under the title “Social Ecology & Ethics” in the spring semester of 2021-2022.

128

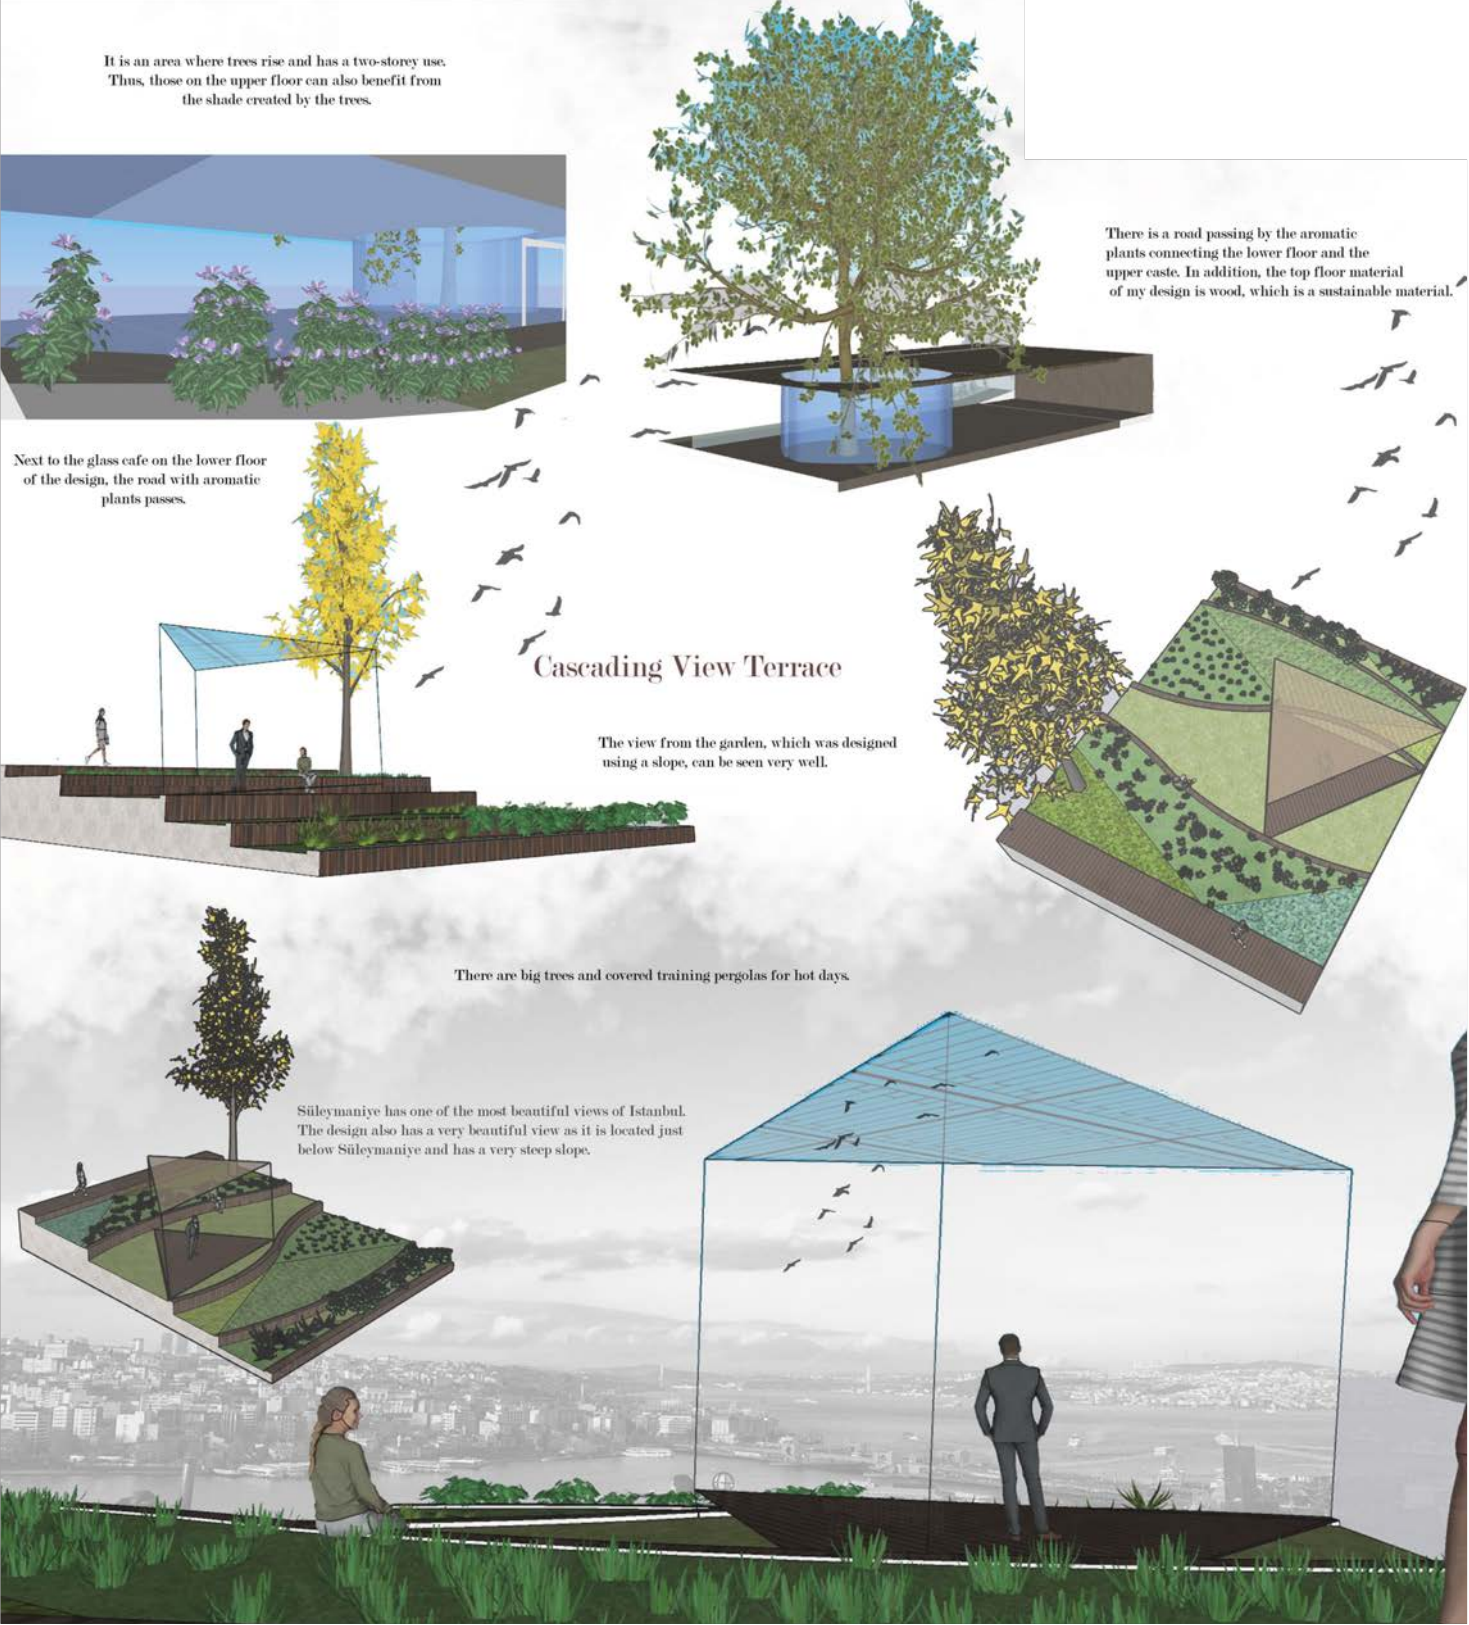

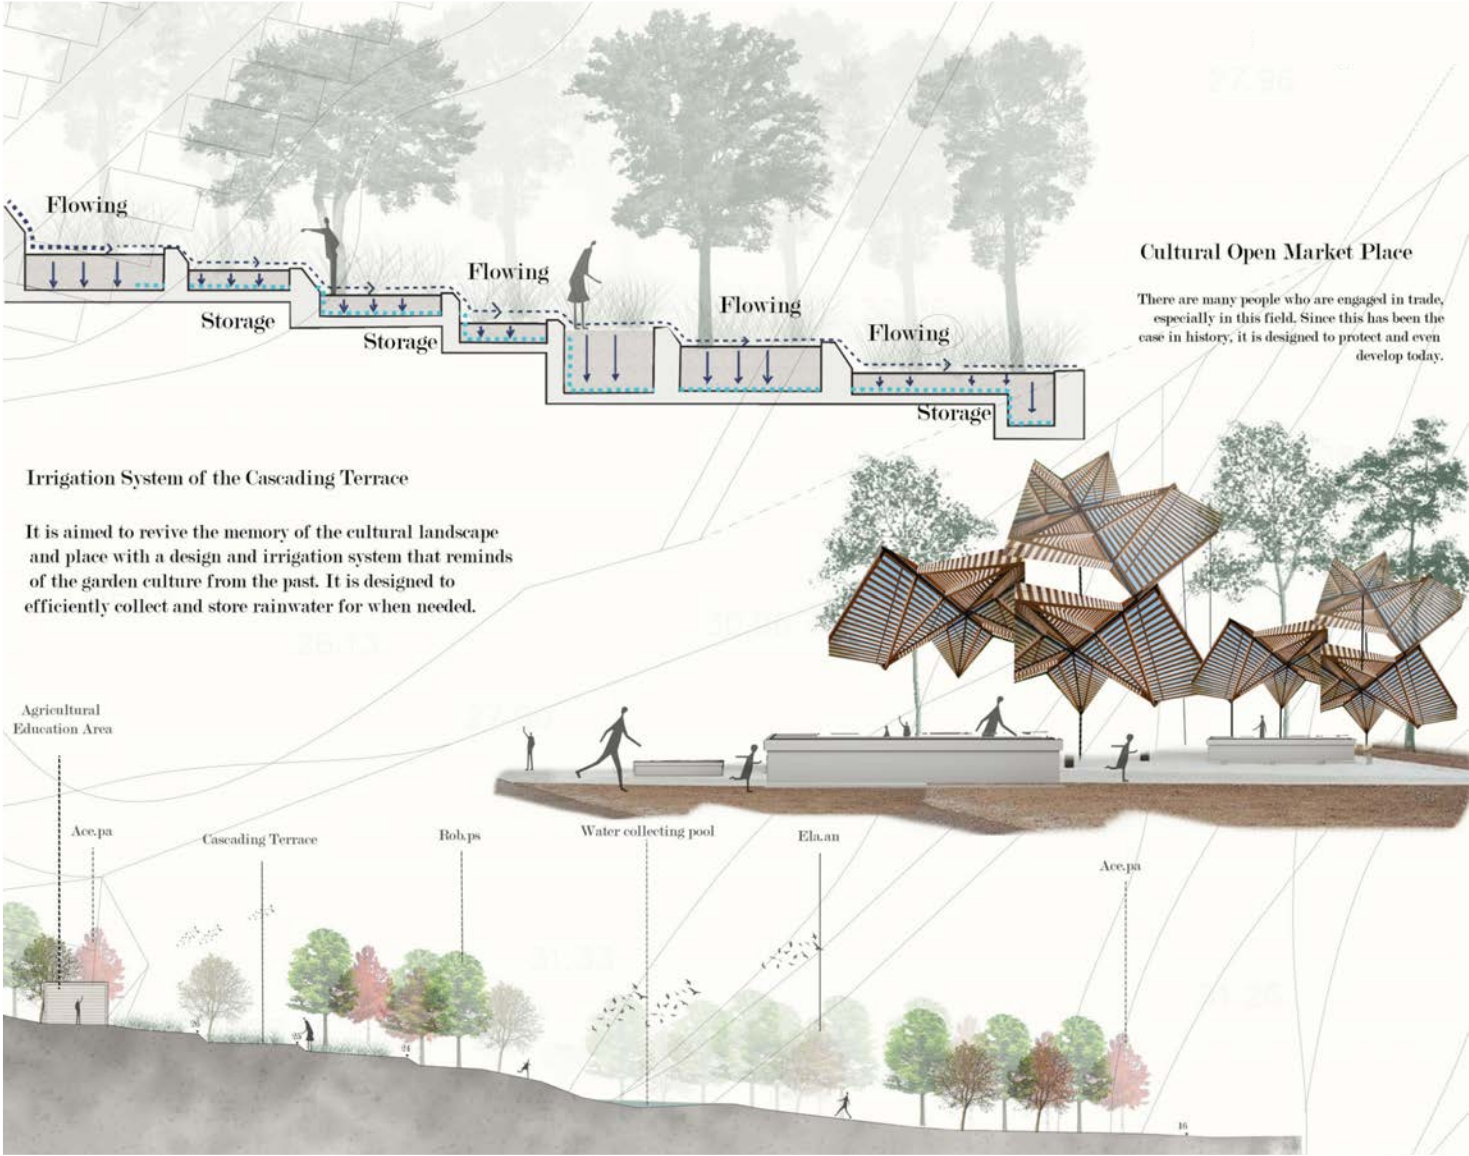

129

Spatial memory reflects the present reality. At the same time, it is shaped by the accumulation of past memories, guiding the present. For this reason, spatial memory is considered multi-layered. Different societies attribute different meanings to various values. When a living space is a shared space, this situation allows events experienced at different times to become collective memories. In other words, the same spaces can hold different meanings in different periods. By understanding this, we can better grasp urban memory. In the past, the Golden Horn was known as a port, trade, and industrial area. Over time, this character has disappeared. Later, a green space was created through various arrangements, but it became disconnected from the city. In this project, the goal is to incorporate the city's past memories, experienced at different times, into the design. For this reason, the memory of buildings

that are on the verge of extinction along the road to Süleymaniye Mosque, chosen for this project, has been brought into the present. Concrete structures like Süleymaniye, Haliç Bridge, and many other historical buildings carry the memories, symbols, and experiences of the past like a soul. The road to the Golden Horn carries an abstract quality that emphasizes the cultural memory of each designed area. Therefore, the design should reflect the spirit of the space throughout its history. This road serves as a bridge between the past and the present. One of the design's objectives is to offer an experience that allows people to witness the memory of a road that has dramatically changed over time. During this process, the design aims to make users forget they are on a sloping area, revealing the view of the Golden Horn gradually, step by step.

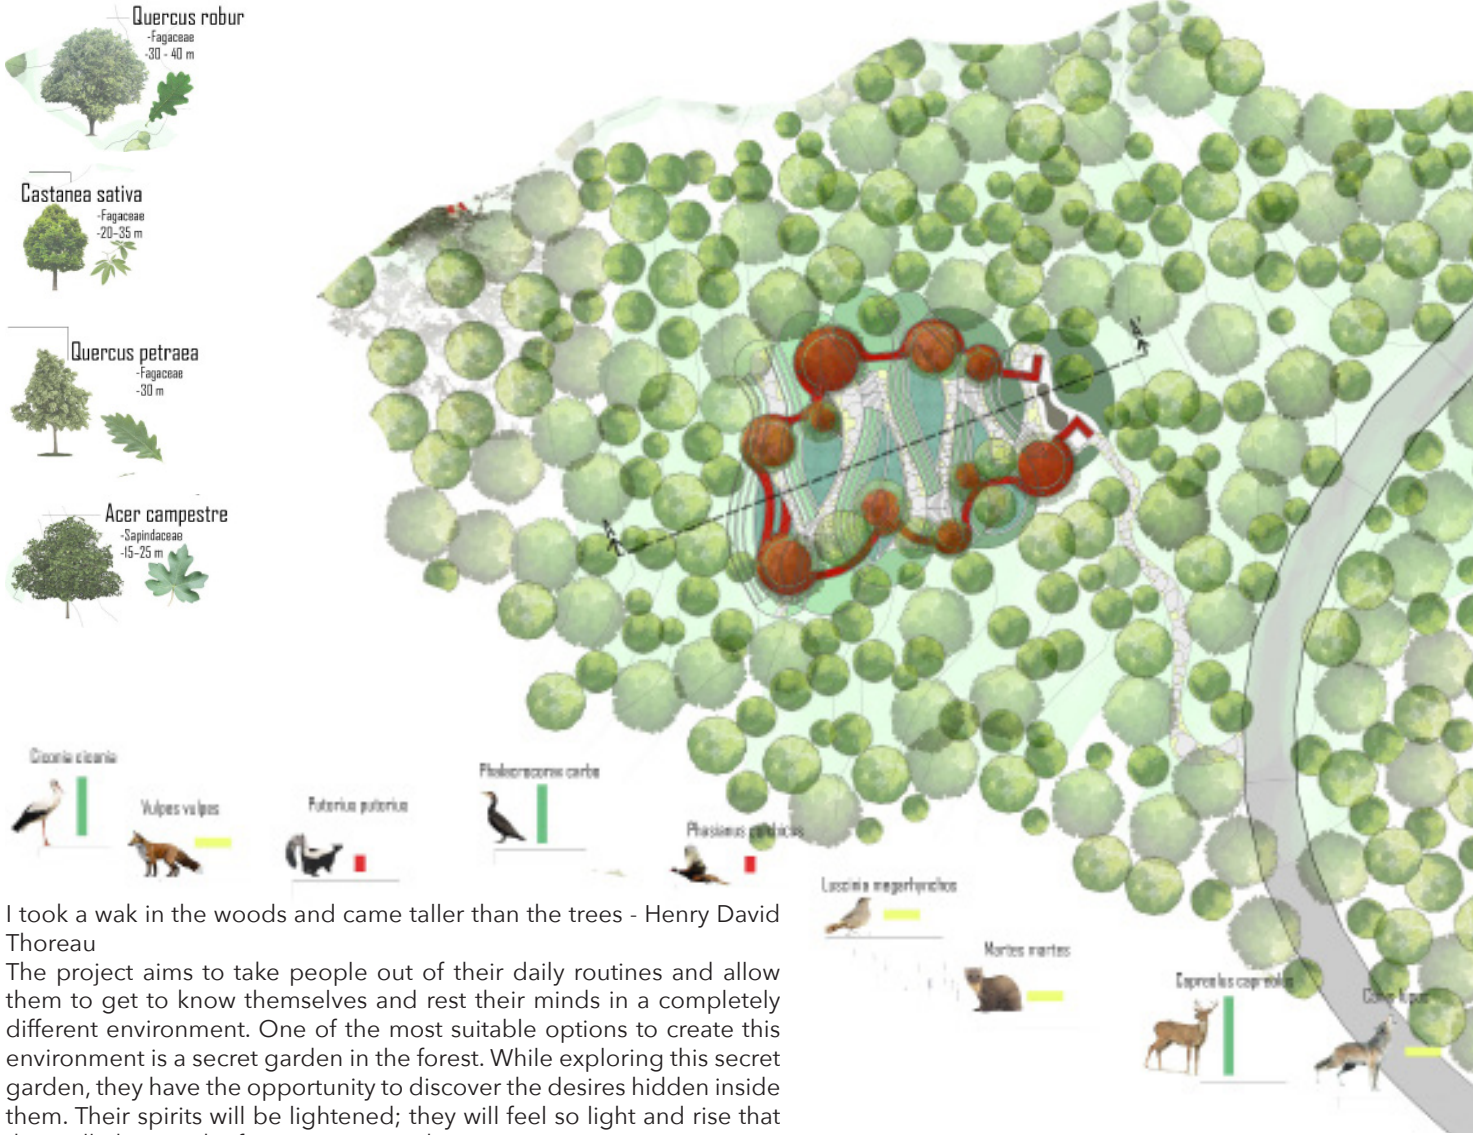

Taller Than The Trees

Halime Sude Kervan

"Taller than the trees" was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Hüseyin Ögçe under the title "Groundwork" in the spring semester of 2021-2022.

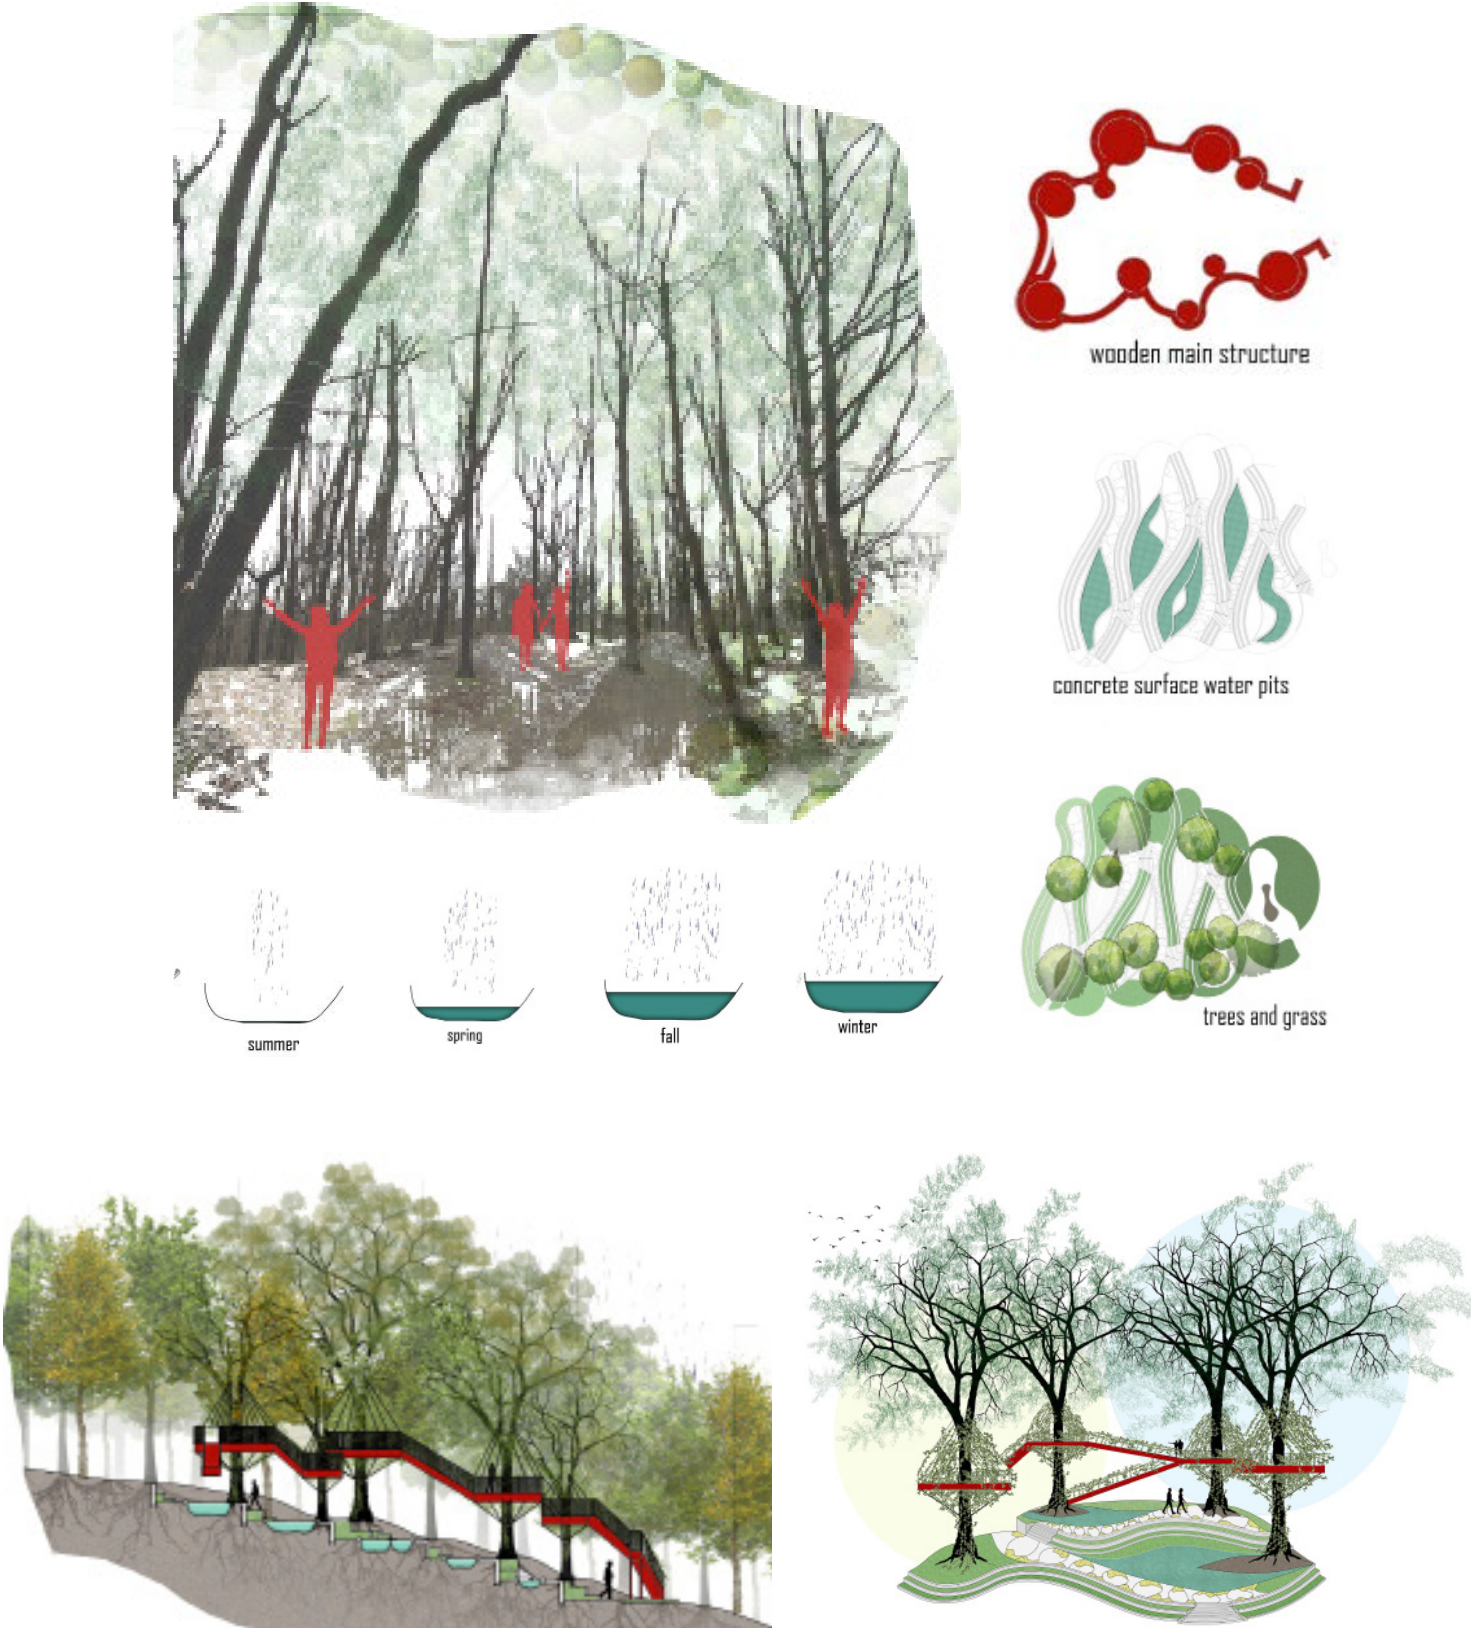

132

I took a walk in the woods and came taller than the trees - Henry David Thoreau

The project aims to take people out of their daily routines and allow them to get to know themselves and rest their minds in a completely different environment. One of the most suitable options to create this environment is a secret garden in the forest. While exploring this secret garden, they have the opportunity to discover the desires hidden inside them. Their spirits will be lightened; they will feel so light and rise that they will observe the forest even over the trees.

Rise is represented by the structure placed on the trunks in the project. People feel as big as trees by getting rid of the troubles that suffocate them and make them feel small. The fact that the garden rises gradually with steps also represents this rise. The water pits used in the middle give people the opportunity to watch themselves from the outside. With the precipitation rate, it receives the water, depending on the season, in the pits increases and decreases, and it can disappear in dry periods. With changes in water levels, people are given the message that everything in life is temporary.

133

Fern Gardens

Yelda Nur Özcan

"Fern Gardens" was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Hüseyin Ögçe under the title "Groundwork" in the spring semester of 2021-2022.

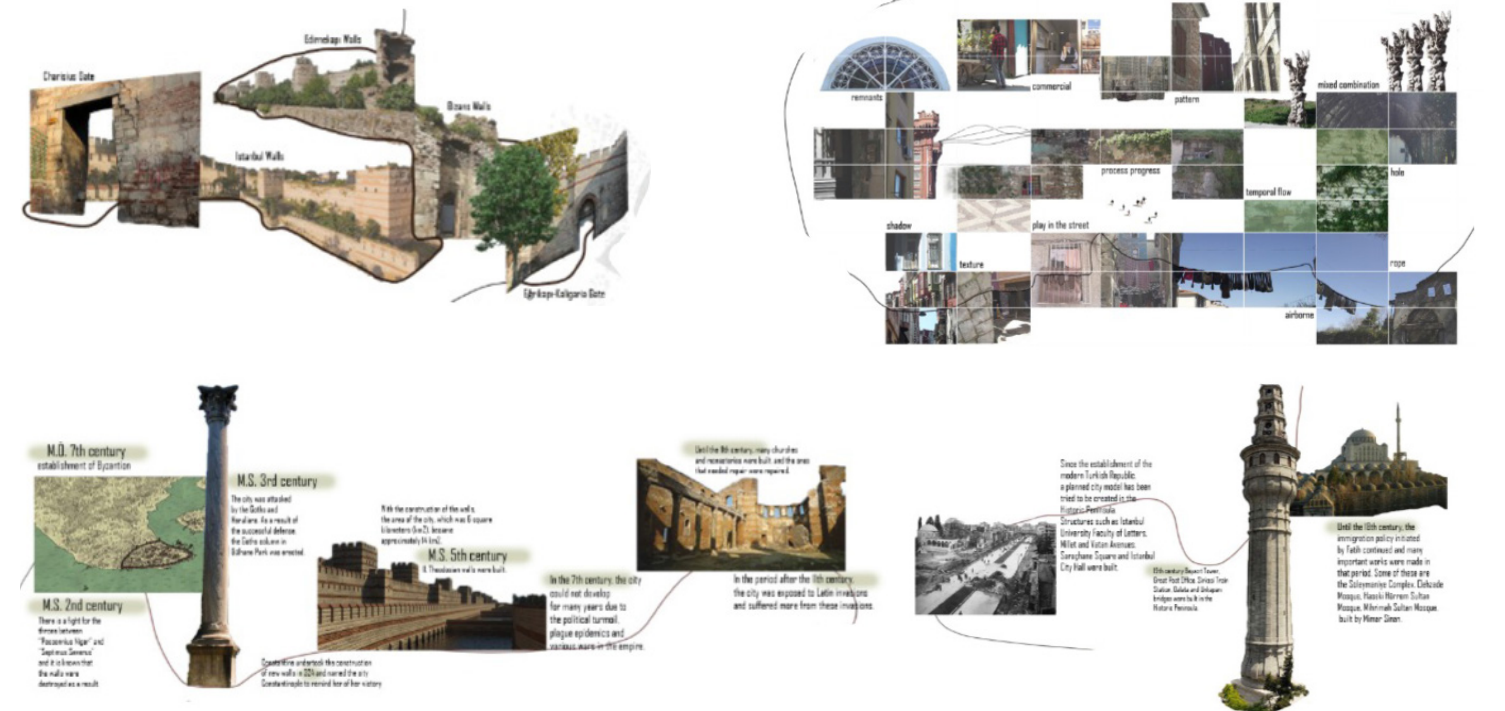

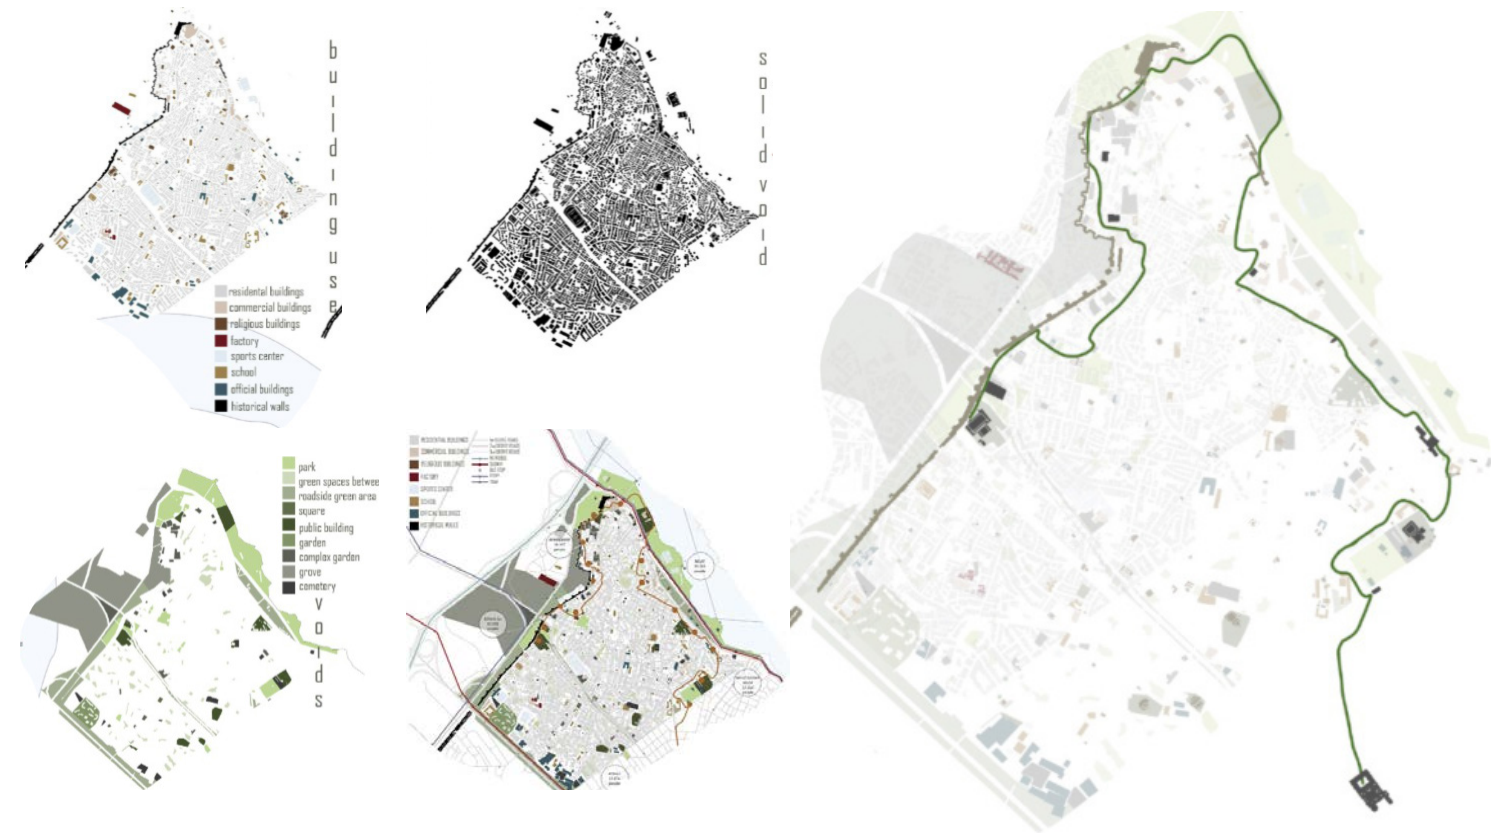

Trees are prominent in the Belgrade forest. Ferns also live in this forest, which contains many plant varieties. Although they are inconspicuous, they are very important for the forest ecosystem. For this reason, the use of ferns in the gardens exaggeratedly brought them to the fore. At the same time, by changing the topography, elevations greater than human scale were created in some parts. This makes people feel small in the garden. There are three different garden alternatives. What these gardens have in common are primarily ferns. Artificial hillocks used to increase dominance, There are different types of pedestrian bridges so that people can see the garden from above and create a nice walking experience.

Safe Space Bond

Berra Kafalier / İrem Melek Akın / Sude Çetinkaya / Caner Öner

"Safe Space Bond" was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Hüseyin Ögge under the title "Groundwork" in the spring semester of 2021-2022.

High Green

Halime Sude Kervan

"High Green" was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Hüseyin Ögçe under the title "Groundwork" in the spring semester of 2021-2022.

In the Fatih district, green areas are mostly located on the outskirts. Our group's concept is to create a green infrastructure that continues the green axis both on the periphery and within the district. The High Green project aims to connect the coastal and inland green areas, forming a unified whole. This integrity is achieved by using a geometric pattern throughout the design. This overpass project links the coast and the interior through an ecological corridor. Pedestrians can easily cross the street using ramps that facilitate quick passage. In addition to serving as a pedestrian overpass, the project offers many functions. It helps alleviate the parking problem in Fatih by providing a parking lot, while its green spaces contribute to ecological life. At the same time, these areas offer people a chance to relax and breathe in nature. One of the key elements of the design is the combination of wooden and concrete steps. These steps create spaces where people can spend time. The height differences in the steps give the design a dynamic look and incorporate bird gardens. These bird gardens allow users to observe the birds of Istanbul. Plants in the gardens are specifically chosen to attract birds. Additionally, a playground for children has been designed, making use of the height differences seen throughout the project. The inclusion of a basketball and football field for young people ensures the area appeals to all age groups.

Bottom of the Wall

Cansın Lal Gürler

“Bottom of the Wall” was produced within the scope of Landscape Design 1 carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Hüseyin Ögçe under the title “Groundwork” in the spring semester of 2021-2022.

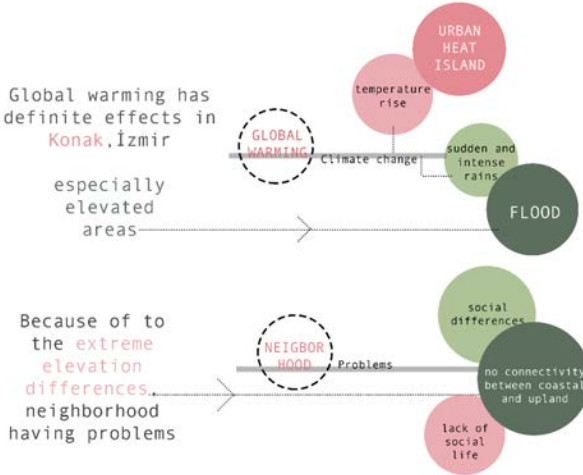

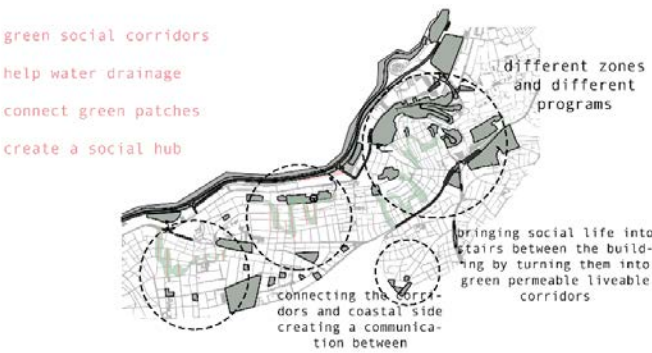

The project area is located in the lower left corner of the historical peninsula, encompassing the Yedikule, Aksaray, Koca Mustafapaşa, Sümbülefendi, and Cerrahpaşa districts. This area is home to many significant historical artifacts, including land and water city walls. To better understand and analyze the site, we studied the buildings, the voids within the area, the interactions of these voids with their surroundings, building heights, and conducted shadow analyses. After the analysis, it was found that the voids in the area are either enclosed spaces within building complexes or ruins between buildings. Upon careful modeling and examination, these voids were deemed inefficient for use in the design proposal. As a result, other areas that could be used more effectively for the design were considered. The goal is to carry the green spaces along the project area's borders and the coastline into the interior parts of the city through roadways. The design also aims to support the area's green spaces with a blue-green infrastructure, ecological landscapes, and community open spaces/social landscapes. The area adjacent to the city walls has been designed as a wide meadow to avoid overshadowing the city walls, providing a comfortable space for people to use. Additionally, a truck farm has been integrated into the area to connect the project with its surroundings and reinforce regional culture and interaction.

Social Steps

Güliz Yalçın

“Warm(n)ing Izmir: Social Steps” was produced within the scope of Landscape Design 2 carried out by Assoc. Prof. Ebru Erbaş Gürler and Res. Assist. Arzu Güler, Res. Assist. Çisem Demirel and Res. Assist. Merve Aydınli under the title “Warm(n)ing Izmir: Adaptive Design Strategies for Global Climate Change” in the fall semester of 2018-2019.

INFORMATION ABOUT PRINKIPO(BUYUKADA)

PRINKIPO

It is the largest of the islands and the center of the Adalar district. It has an interesting history full of tragedies. It is famous for being the place of exile of many Byzantine emperors and empresses. History: Megale, Prinkipos, Demonissia, Prinkepo, Kuzlada, Prince Island as the names were mentioned.

The largest and most visited of the Princes' Islands, Buyukada's history dates back to the Ancient Period. Buyukada's history is full of exiles and its name is derived from the exile of princes.

EXISTING USER PROFILE

Local people
Tourist

HISTORY

After the First World War and the Republic, the Greek people lost their vitality in Buyukada until the 1930s. However, towards the 1940s, the Republican period and the high bureaucracy of the state, the prosperous sections of the resort has become a popular destination. In this period, Buyukada was decorated with new pavilions, elaborate and tasteful buildings, and was at the beginning of the daily sightseeing places of Istanbul people.

TOPOGRAPHY

There are two hills on the islands, one in the south and the other in the north. The hill to the south is Yucetepe, 203 meters high. To the north is the Hill of Jesus.

SOIL

The soil of the islands is iron oxide red soil. Plenty of iron sprouts mixed with lime layers give the soil a red color. This soil is suitable for tree, fruit, vegetable, flower cultivation. The environment is rich in minerals.

Lovers Way
Historical Places

From the past to the present, this project has been developed with a focus on the richness of literature, cultural traces, and both tangible and intangible heritage. Initially conceived on the scale of Istanbul, the project was planned to gradually narrow down to the scale of the island and conclude accordingly.

First, both group and individual analyses were conducted to gather information about the study area, followed by an in-depth examination of literature within the conceptual framework. The project specifically explored the historical trajectory of literature, leading to the development of a self-managed project system.

The primary objective of the project was to design an open-air museum aimed at fostering greater engagement among the island's general population while introducing both local and international visitors to the processes and identity of Turkish literature.

COLLAGE OF CONCEPT

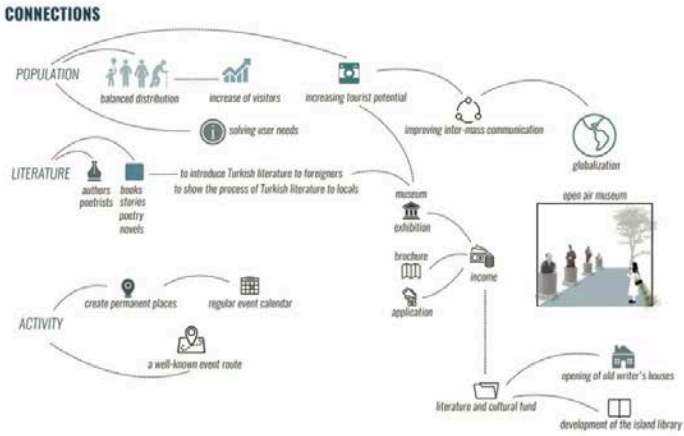

With reference to the processes of literature, the project was structured under four main headings. The design prominently features the concept of a three-period park and a museum, spatializing the evolution of Turkish literature across the past, present, and future.

The Present Park serves a daily function, providing a space where individuals and groups can sit, relax, write, draw in solitude, and observe the sunrise from an area conceptualized as a “sunrise terrace.” The Future Park incorporates an interactive walking route shaped by contemporary influences, where users play an active role

KEYWORDS

CONCEPTUAL STRATEGY

in the narrative. Here, the visitor becomes the primary reference point, creating their own story by selecting their preferred path. In the section of the project designated exclusively for museum purposes, the natural topography plays a guiding role. The design features square-shaped axes running parallel to one another, connected by stairways that adapt to the terrain’s slope. These axes are equipped with statue bases, where sculptures will be arranged following a mixed-concept approach. The primary objective is to create an exploratory experience, allowing visitors to engage with the space freely without being constrained by chronological or period-specific knowledge.

PRINCE ISLANDS AND PRINKIP MAPS

Early 19th century engraving by Melling on the Princes' Islands (Tuğlacı, 1989)

Engraving showing the Princes' Islands at the end of the 18th century (Carbognano, 1993)

Market boats providing transportation to the islands at the end of the 18th century and the first half of the 19th century (Tuğlacı, 1989)

Picture of one of the passenger ferries of the Şirket-i Hayriye (Tuğlacı, 1989)

The studied area features a dense red pine ecosystem. Consequently, plant species that thrive in acidic soil were predominantly selected. The primary material used in the project is wood, aligning with the concept of nature and sustainability. In the History Park, nine distinct periods of Turkish literature have been interpreted through axial representations: Pre-Islamic Period, Islamic Period, Turkish Folk Literature Period, Divan Literature Period, Tanzimat Literature Period, Servet-i Fünun Literature Period, Fecr-i Ati Literature Period, National Literature Period, and the Literature of the Republican Period. These axes, varying in length and width, converge at designated intersections, forming a series of squares. The purpose of these squares is to establish spaces for cultural activities on the island while also providing relaxation areas within the forest. Over time, the cultural events hosted in these squares will contribute to a funding mechanism for the project’s sustainability, supporting further cultural investments and enhancing the island’s literary and cultural heritage. The project also incorporates two viewing terraces. The Sunset Terrace, which is thematically linked to the past park, evokes a sense of nostalgia. This terrace offers panoramic views of Dilburnu, Heybeliada, and Istanbul. To facilitate movement throughout the site, circulation has been resolved with a network of stepping stones, which seamlessly connect the terraces and squares to the main road at various points, ensuring accessibility and continuity across the design.

Eco-Energy Island

Begüm Karademir

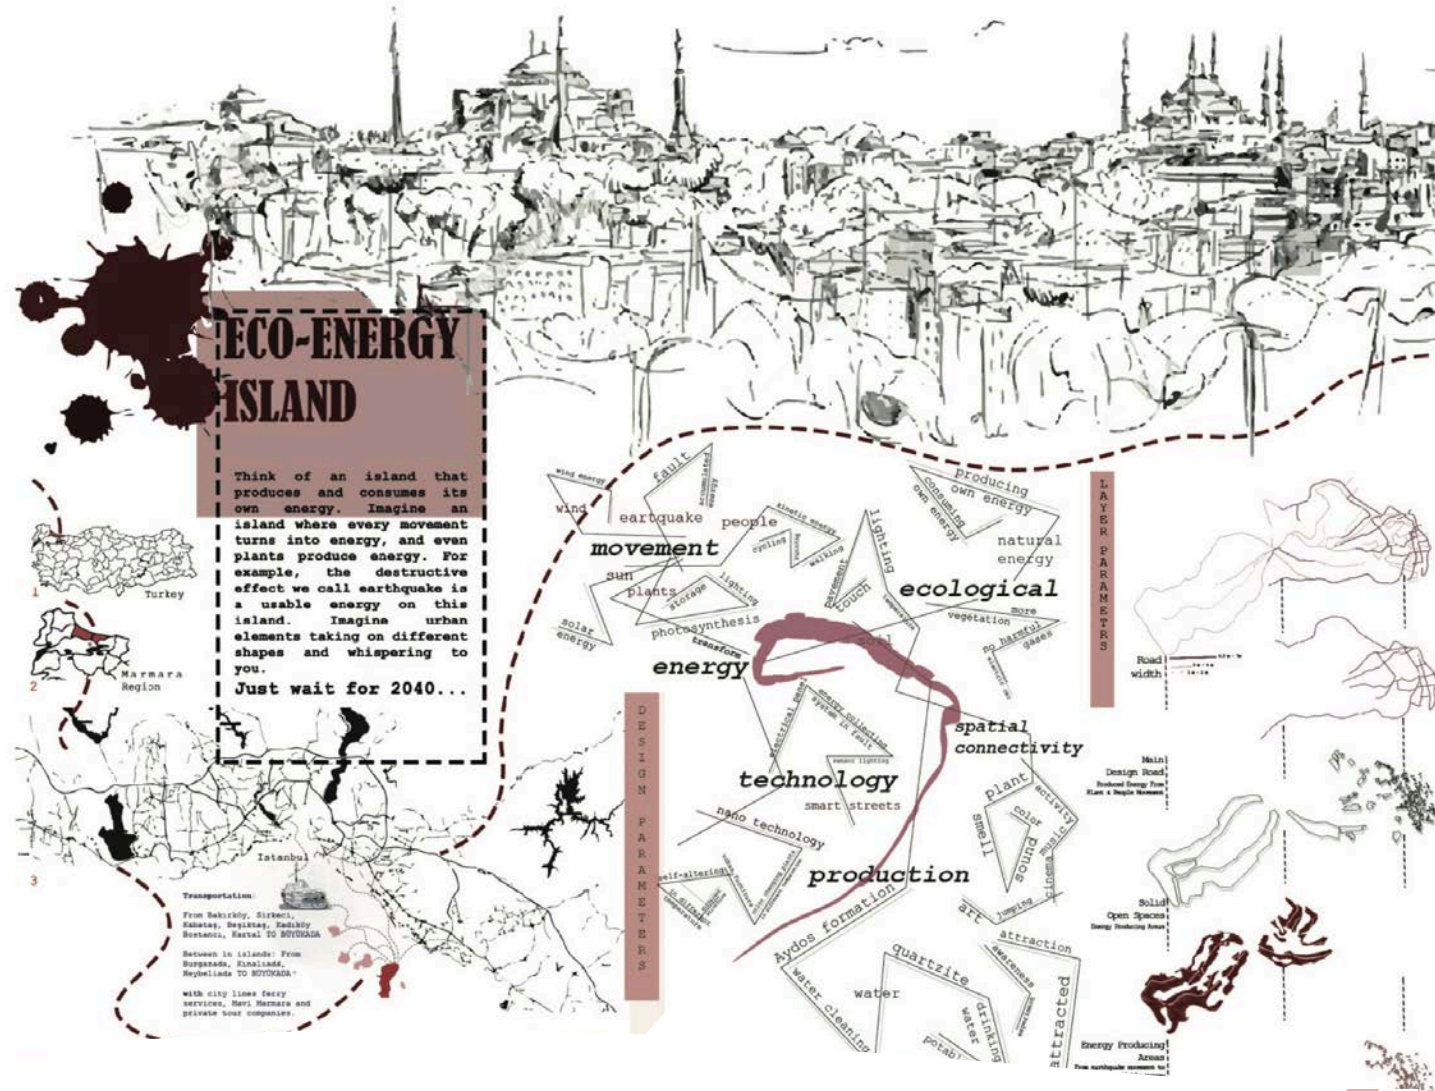

“Eco-Energy Island” was produced within the scope of Landscape Design 2 carried out by Assoc. Prof. F. Ayçim Türer Başkaya and Res. Assist. Çisem Demirel under the title “Atlas of Literature İstanbul” in the fall semester of 2019-2020.

In my vision for Büyükada in 2040, I conceptualized the island as a self-sufficient entity that both produces and consumes its own energy. One of the most pressing global challenges today is climate change, driven primarily by global warming. The adverse effects of these phenomena are already evident and will continue to intensify unless effective solutions are implemented.

Given the rapid depletion of non-renewable energy sources and the environmental damage caused by their use, I believe that advancing sustainable and renewable energy technologies is imperative. With this perspective, I envisioned Büyükada as a fully sustainable and self-sufficient island for the future and structured my project accordingly.

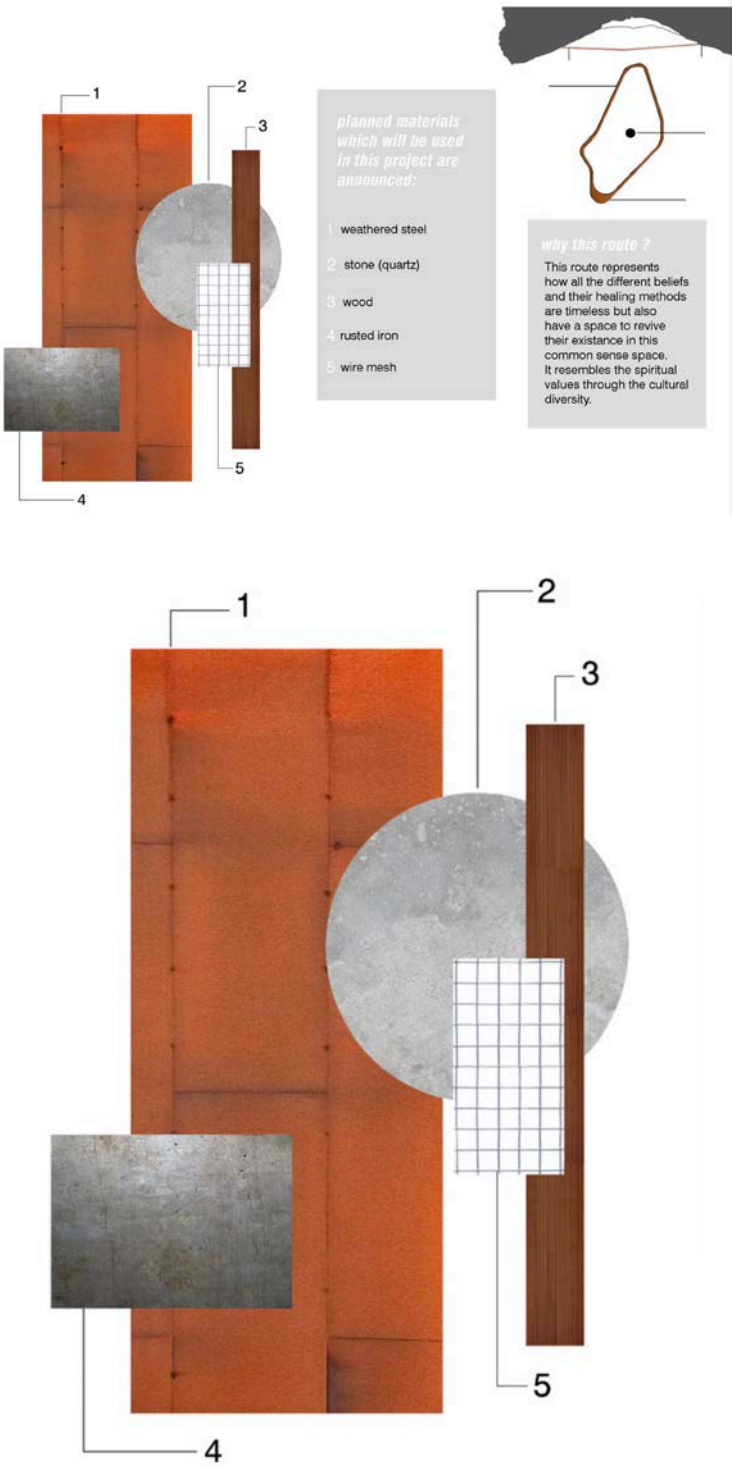

I conducted research on energy generation from human movement and discovered that this system has been successfully tested on a frequently used pedestrian path in England. Utilizing the piezoelectric system, this technology converts kinetic energy into electrical energy by harnessing the movement of people and the pressure applied to the ground during walking. Studies indicate that an individual's average of 4,000 steps per day can generate approximately 9-10 kWh of electricity, which is sufficient to meet the daily energy needs of a household. Based on this concept, I envisioned that the energy demands of homes on the islands could be met through the movement energy generated by residents and visitors.

Another proposal for Büyükada involves utilizing plant-based energy production. During my research, I came across a study conducted by Wageningen University in the Netherlands, which explores the use of electrons released during photosynthesis for energy generation. In this system, bacteria bind to these electrons, allowing for energy capture without harming the plants. By designating a specific agricultural area along the roads, crops can be cultivated to support this energy production method. At night, the energy harvested from plants can be used to power street lighting. Research indicates that 100 square meters of green space can generate enough electricity to meet the daily energy requirements of a household.

Savur is home to one of the oldest continuously inhabited urban settlements in the world. The region embodies a deeply rooted tradition of coexistence in diversity, where various ethnic and religious communities, including Assyrians, Kurds, Arabs, Mahalmis, and other groups, live in close proximity. As a result of this rich cultural mosaic, Savur has produced a wide array of cultural expressions, which can be regarded as tangible heritage. These cultural elements will be incorporated into weathered steel panels through inscriptions and symbols that reflect the rituals and beliefs of the region, serving as a testament to its historical and spiritual significance.

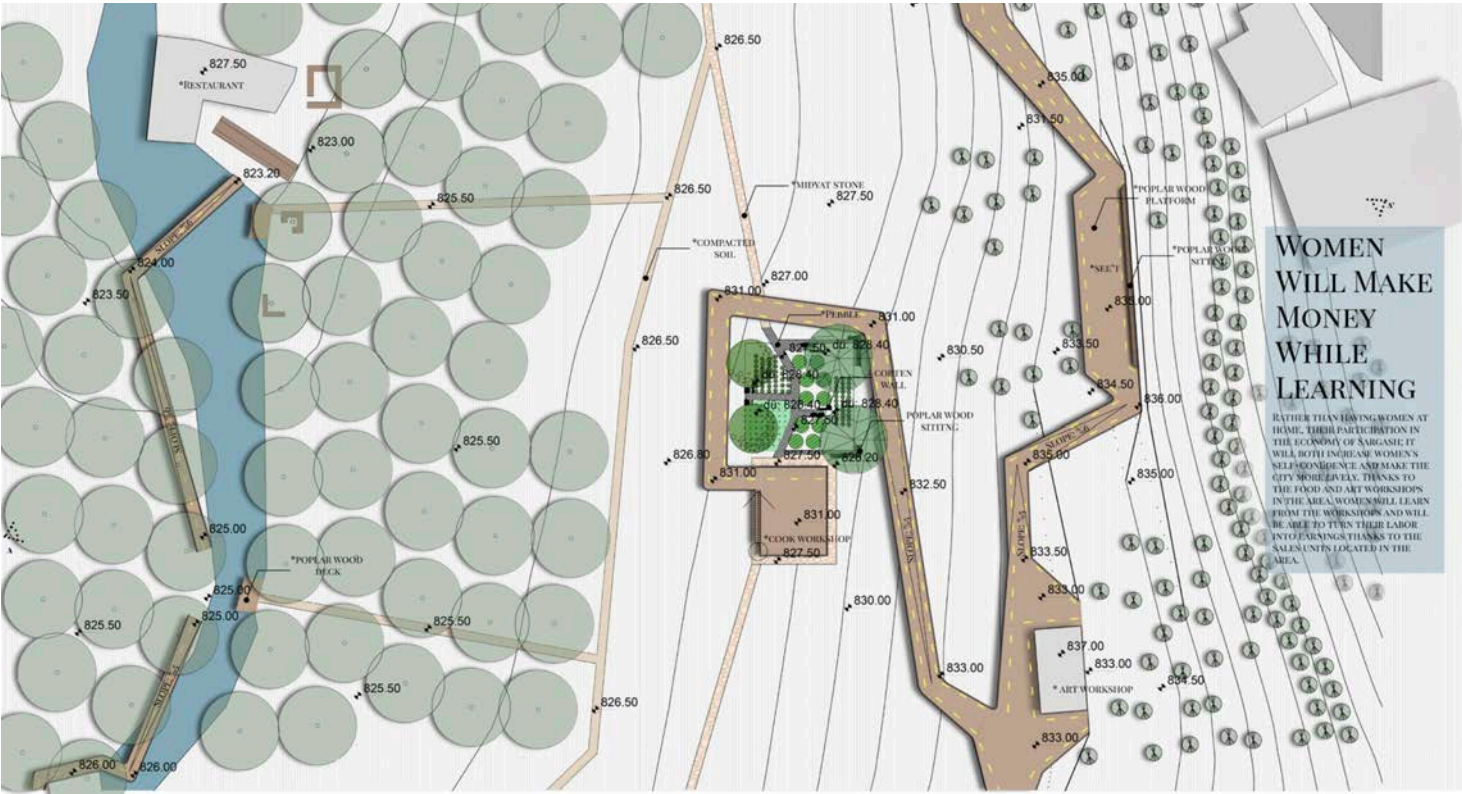

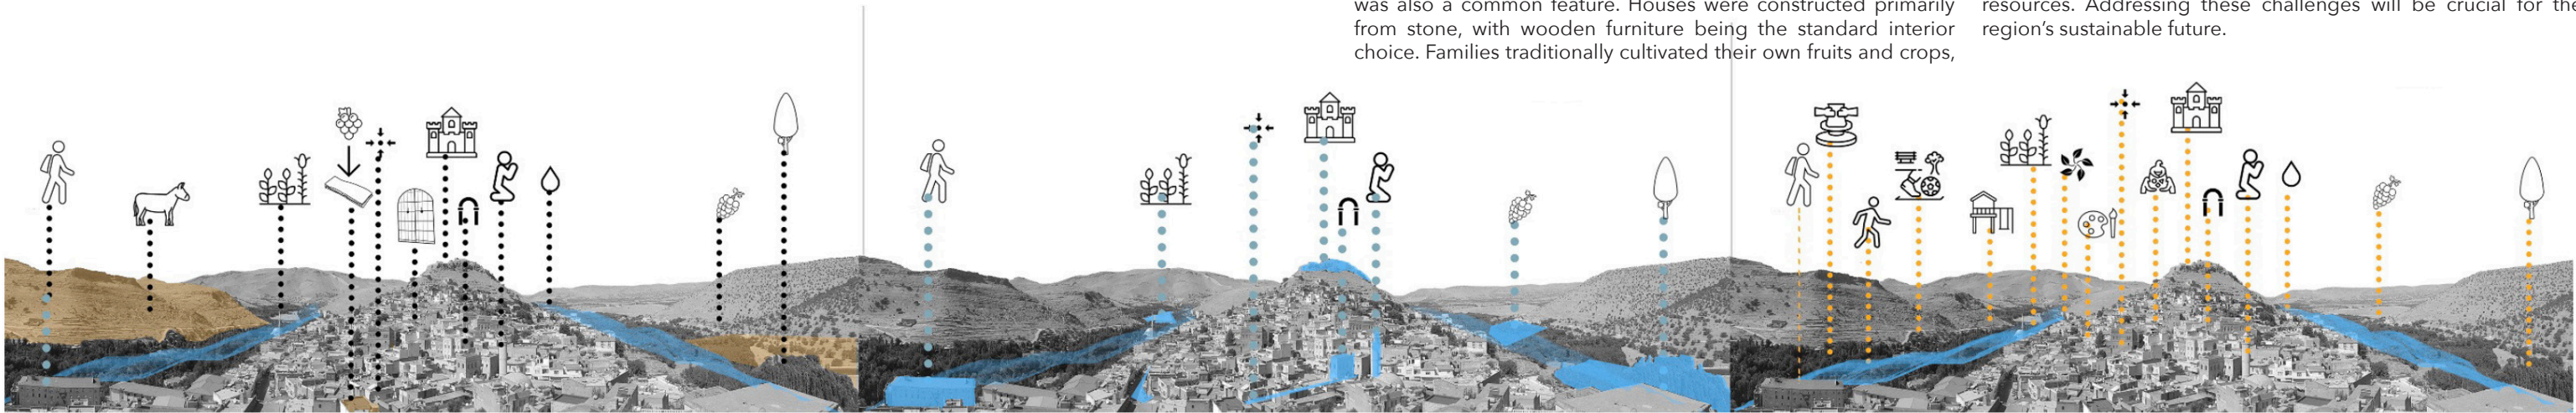

Meditation capsules are designed as a meditative experience integrated into a structured route that connects four distinct religious traditions reflective of Savur's historical and multicultural identity. Although these religions differ in rituals and practices, they share certain fundamental elements. One of the most significant commonalities is the sun and its influence on belief systems. To preserve the interconnection between these religious traditions and to revive the memory of Savur's religious heritage, a central opening was created as a symbolic and spatial representation of this shared spiritual connection.

Memory of Savur

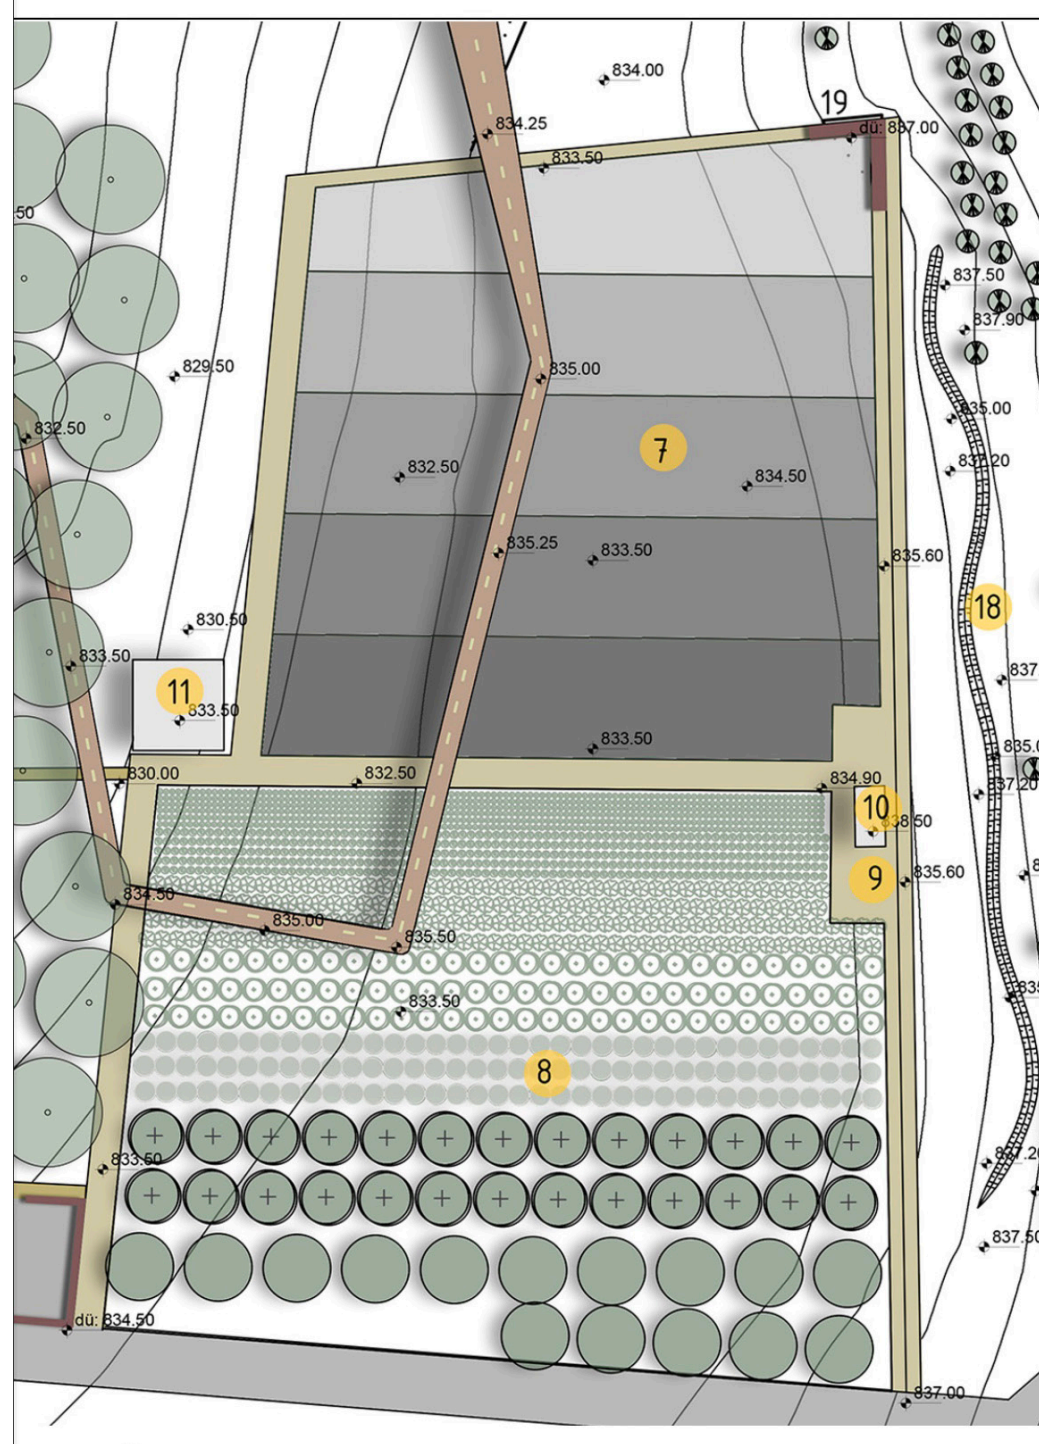

Alara İlter

"Loop" was produced within the scope of Landscape Design 2 carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Arzu Güler under the title "Memo-Structural Landscapes / Savur" in the fall semester of 2019-2020.

Savur is an ancient settlement built upon two hills, with the Savur Castle situated on one of them. Over the centuries, the city center has remained unchanged, preserving its historical fabric. The district's architectural heritage is concentrated in this area, featuring structures such as abbara (vaulted passageways), mosques, and old mansions. Additionally, traditional coffeehouses, where men gather for social interaction, are an integral part of daily life. Descending from the hills toward the valley, the landscape transitions into fields and poplar trees. In traditional Savur houses, water held great significance. Gates with fountains collected and distributed rainwater, while an antique form of a parental bathroom was also a common feature. Houses were constructed primarily from stone, with wooden furniture being the standard interior choice. Families traditionally cultivated their own fruits and crops,

integrating self-sufficiency into their way of life. Additionally, houses included baths for women, designed with a special infrastructure to ensure privacy. In recent years, Savur has been designated as one of the Cittaslow (Slow Cities), emphasizing sustainable urban development and cultural preservation. However, for Savur to thrive and develop, active agricultural production and economic engagement are necessary. Orchards must be cultivated, and local products must be produced to sustain both the economy and cultural heritage. Furthermore, poplar farming, once a significant part of the local economy, has become increasingly unsustainable due to climate change and the unconscious overuse of water resources. Addressing these challenges will be crucial for the region's sustainable future.

The water cycle on Earth follows a continuous process: water falls to the ground as precipitation, collects in streams and reservoirs, and is later utilized for production and consumption. It then returns to the atmosphere through evaporation, completing the cycle. Some theorists have drawn a conceptual parallel between women and water, framing a notion of duality that likens the life cycle of women to the water cycle—from birth to production, consumption, and renewal. Savur has historically been a preferred settlement due to its favorable landforms, fertile soil, and proximity to vital resources. In the past, the region supported diverse agricultural practices such as mulching, viticulture, and winemaking. However, these industries have declined due to resource depletion, the loss of traditional crafts, and a lack of skilled artisans. Today, economic stagnation has led to an exodus of the younger population, as employment opportunities are scarce. For those who remain, men gather idly in coffeehouses, while women spend most of their time at home, with limited opportunities for social or economic participation. To address these challenges, a new project has been developed to revitalize an underutilized area located between the poplar groves along the Savur Stream and the main road. This initiative aims to serve the public and enhance the region's socio-economic and cultural value. The project will feature three distinct types of gardens: A tree garden, an edible plant garden, a perennial garden.

The materials selected for the project are native to Mardin, ensuring a seamless integration with the local environment. Steel has been chosen due to its rusting properties, which symbolize the passage of time and the preservation of cultural memory. Mardin stone is incorporated to reflect the existing architectural identity of the region, reinforcing the connection between the built environment and the local heritage. Additionally, naturally occurring plants from Savur have been integrated into the design, further strengthening the site's ecological and historical continuity. Through this approach, the project aspires to bridge the past and present, revitalizing Savur's cultural and economic landscape.

MATERIALS

CORTEN PAVEMENT

"A PROJECT THAT REVIVES SAVUR. PERFECT FOR SPENDING TIME WITH FAMILY."

-EBRU ERBAŞ GÜLER

"NATURE INTERWINED. TO COME HERE, TO BE RENEWED."

-ARZU GÜLER

"VERY GOOD DEVELOPMENT FOR SAVUR. BOTH THE PUBLIC AND THE SAVUR WILL DEVELOP FURTHER."

-CEMİL AKTAŞ

"MAKE SAVUR GREAT AGAIN"

-ALARA İLTER

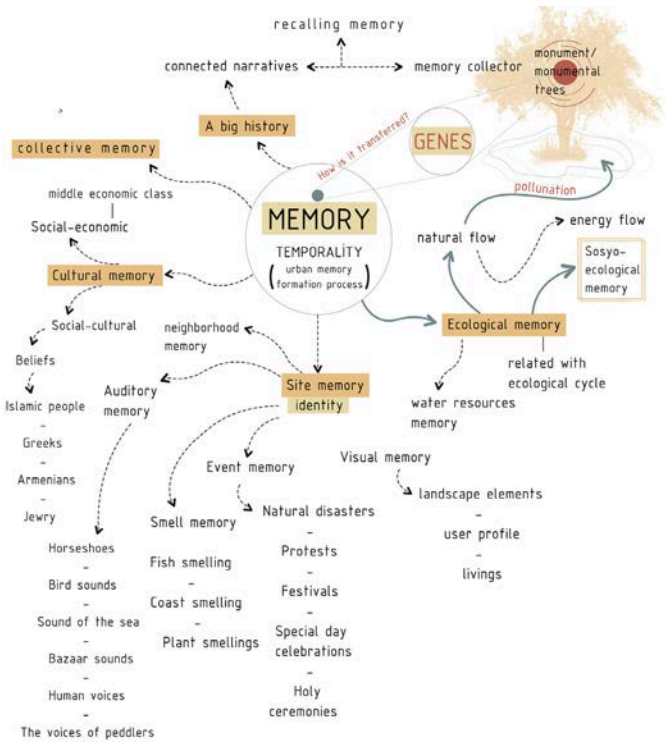

Additionally, the project will incorporate cooking areas, craft-learning spaces, communal seating areas, and a restaurant. A deck will be constructed around the site, providing visitors with scenic views and immersive experiences. This initiative seeks to empower the residents of Savur, particularly women, by teaching them new skills related to food preparation, agriculture, and traditional crafts, thereby fostering greater social engagement and integration into daily life.

Memstory

Nuran Kul

“Memstory” was produced within the scope of Landscape Design 2 carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Nergis Aşar under the title “New Normal / New Old: Rethinking of Neighbourhood Landscape” in the fall semester of 2020-2021.

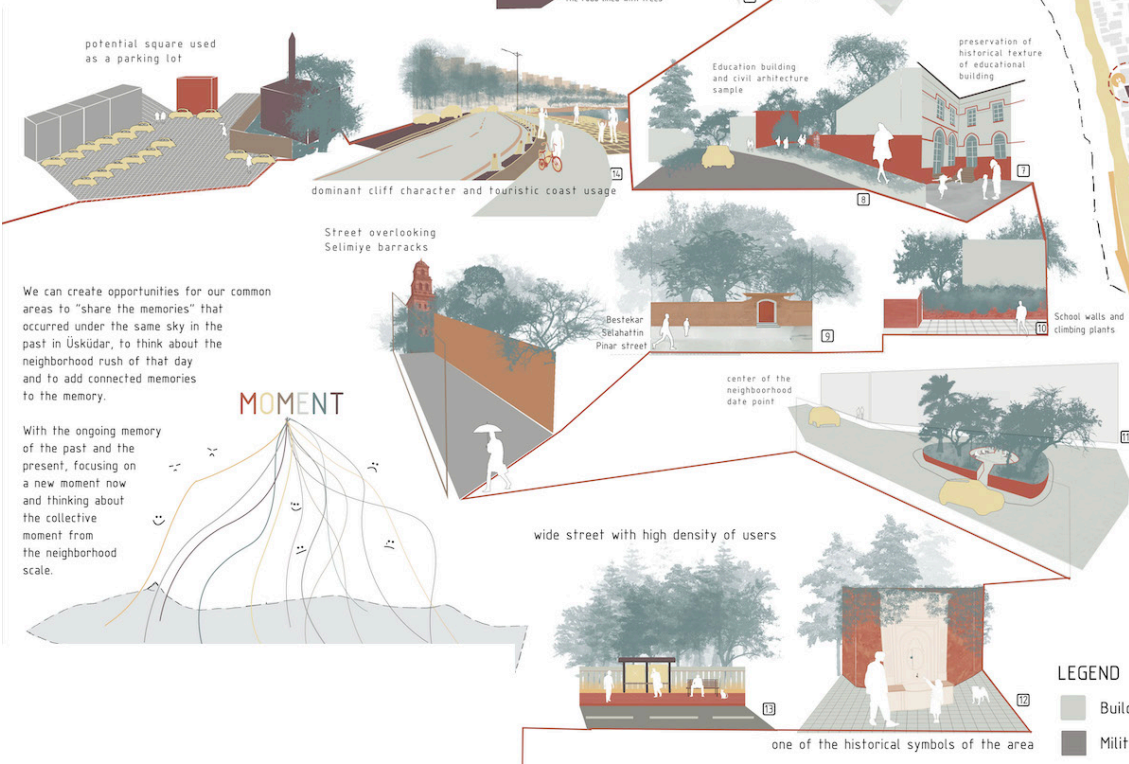

The primary objective of this project is to create spaces that preserve and convey the city's social and ecological memory, while also designing open spaces that align with the evolving norms of urban life. The project is centered around the concept of “MEMSTORY,” a term that emphasizes the historical continuity of the city and establishes a connection between the past and the future. This concept was chosen as both the name of the project and

its overarching theme. Through extensive spatial analysis, areas containing traces of the city's history, particularly monumental trees within neighborhoods, were identified and classified at a broader urban scale. Based on these findings, strategies were developed to enhance the green connectivity within the city by analyzing the relationships between urban open spaces. The project focuses on several key interventions, including:

- Enhancing the utilization of historically significant areas to strengthen the sense of belonging among residents.
- Revitalizing open spaces to ensure they remain functional and accessible in light of the city's new urban norms.
- Transforming underutilized green spaces and inactive areas into integrated, usable, and accessible public spaces that reflect the city's cultural and ecological values.
- Strengthening the green connection between the cliffs within the city and the Karacaahmet Cemetery, thereby improving urban continuity and environmental integration.

Through these interventions, the project aims to preserve historical and ecological memory, enhance urban livability, and establish a sustainable framework for future urban development.

FOLLOWING THE HISTORICAL TRACES

The neighborhood is the smallest social units where the community can have close neighborhood relations. As a district, it has physical boundaries determined in historical processes. While these boundaries connect the neighborhood with other neighborhoods, they also have some heritages that characteristically distinguish them from others. Salacak and Selimiye neighborhoods also have the most important urban elements in their history and the neighborhood cannot be considered separate from these images that keep its identity alive.

- LEGEND
- Buildings
 - Military structures
 - Park and meeting areas
 - Ecological and emotional

SOCIAL, ECOLOGIC AND CULTURAL Spatial Temporal Collective Units

a little bit rotate your daily way
to the **EXPLORE THE TRACES
OF NEIGHBORHOOD MEMORY**

For local people, to make certain identity and location-specific images noticed by various stimuli that people do not notice in daily use.
For outsiders, by following the stimuli in the area, to make more visible the characteristic identity traces that can be preserved in parts at the neighborhood scale, to simplify the access by combining these traces.

REMINDER LINKAGE

The area, which is the center of the reminder linkage, offers people the opportunity to stop and relax at the same time to explore the environment.

RECOLLECTION of local people with water memory

Water resources have created a sense of conversation and encounter among people with the fact that they are made in places close to the settlements of people in history and they are daily destinations. Today, this memory has been thrown into the background. Water is vital for all living things, and at some point, the neighborhood corpse Silahatir Mustafa Ağa Fountain, which has water resources, can become "the destination of people again" with its unification and easy access. The water comes from the neighborhood and turns into the neighborhood.

Common sharing and daily use urban picnic areas can be a suggestion to spend a healthy time, especially during the pandemic period. It is also a place that increases the bond with other green areas.

SOCIO-ECONOMIC LINKAGE

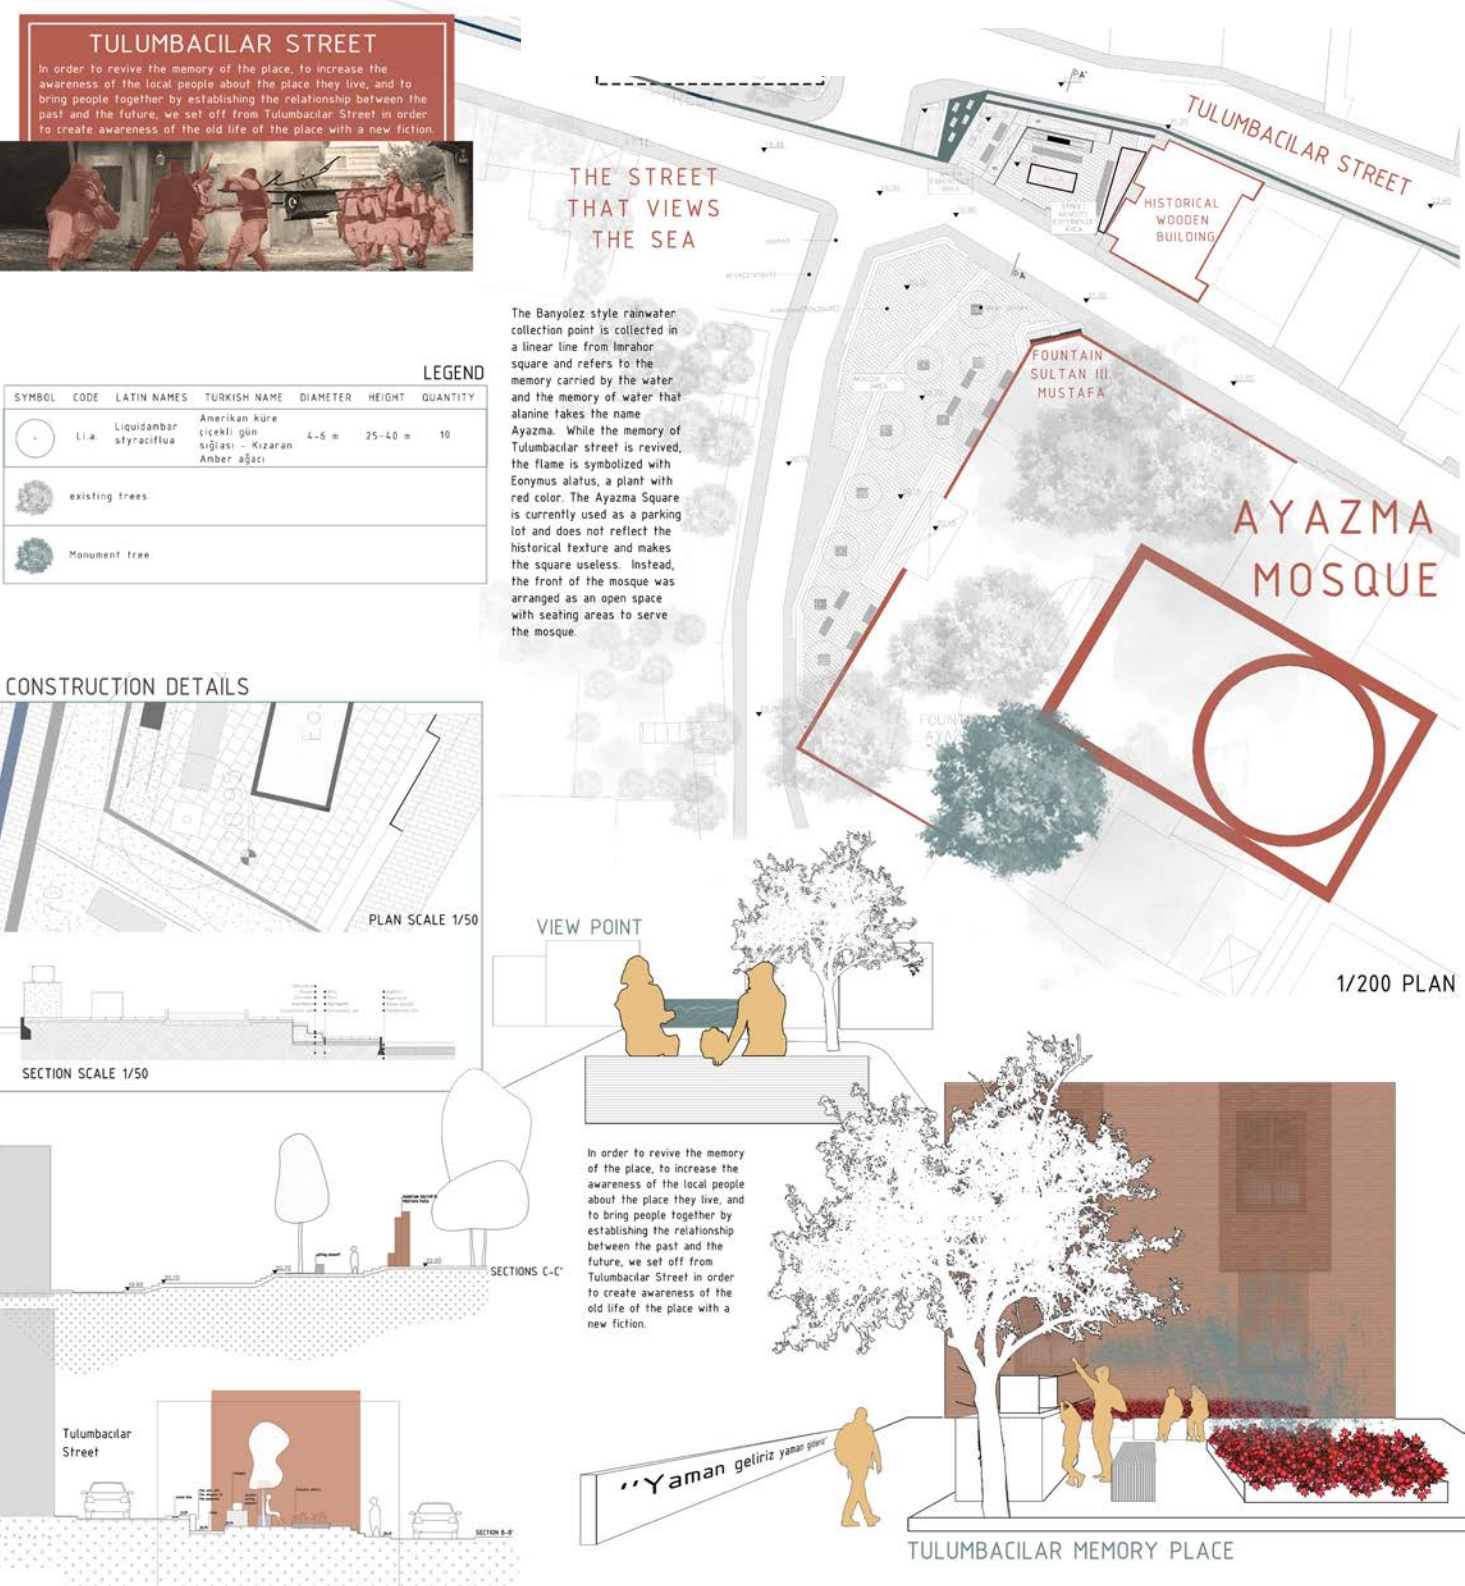

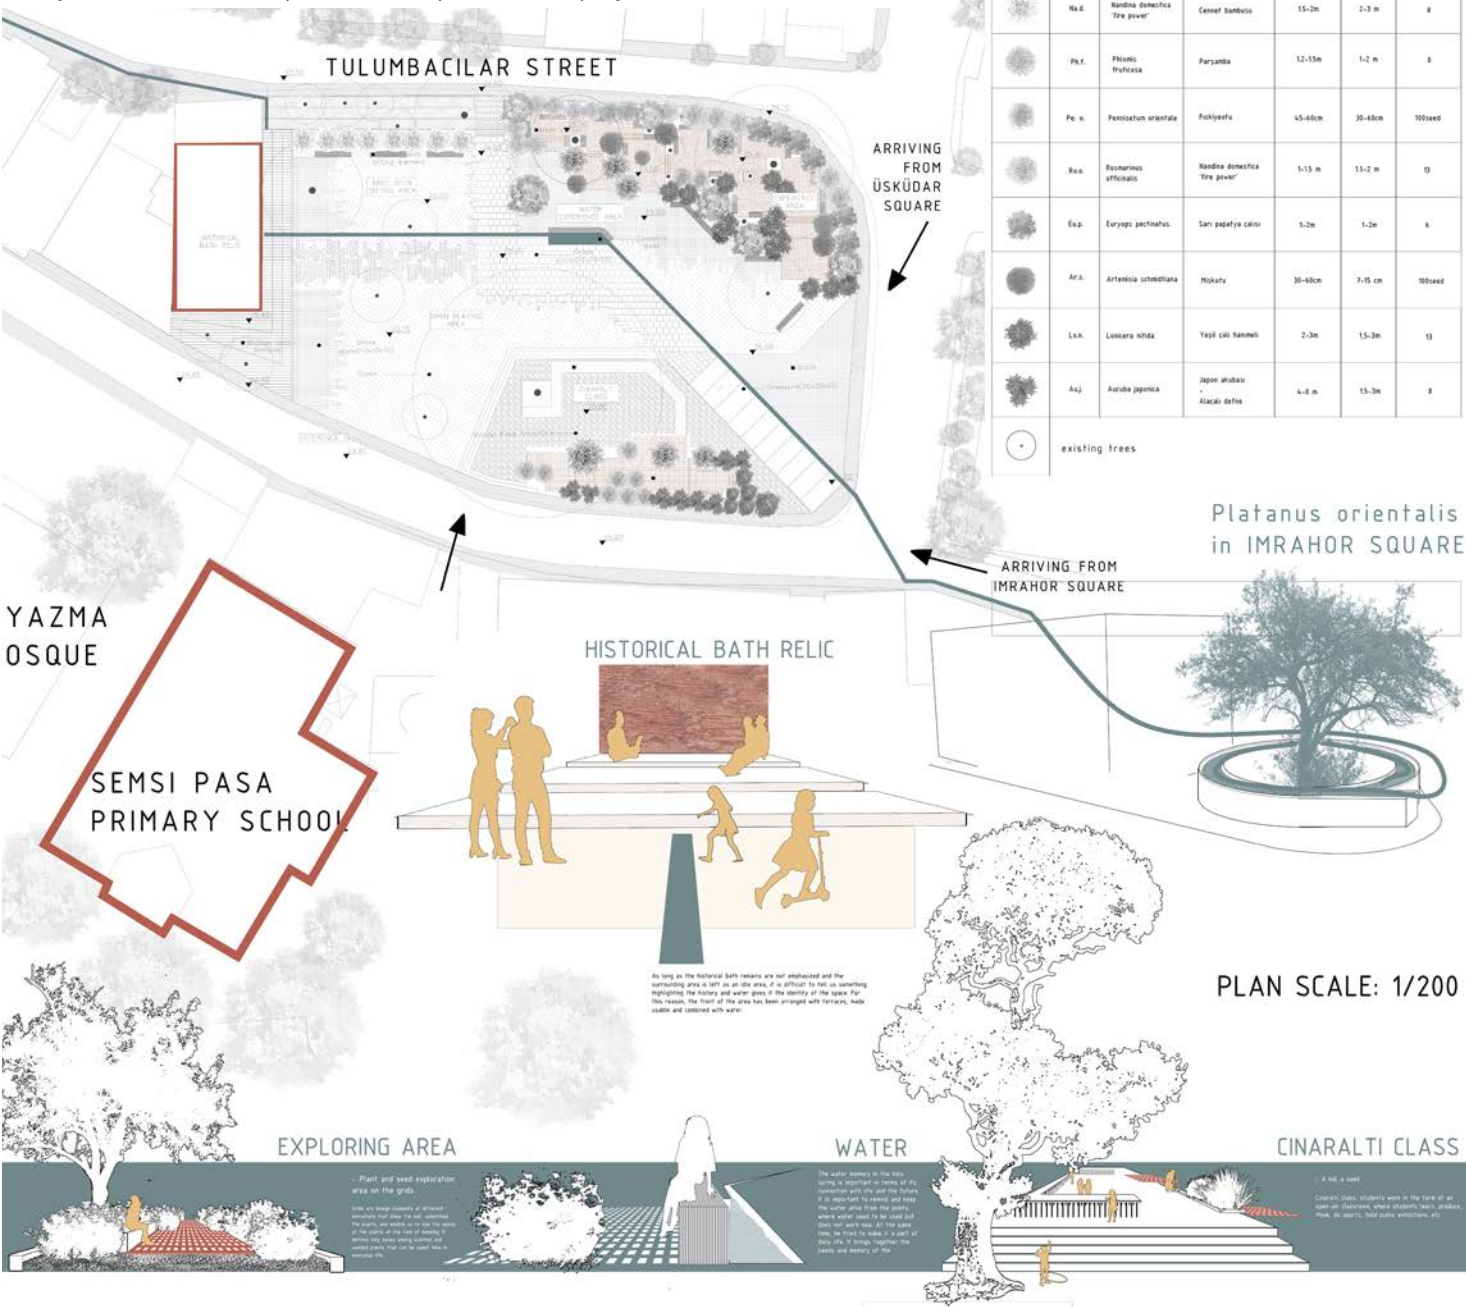

FEEL the voice and the soul of place
(horseshoes, bird sounds, sea sounds, voices of people, peddlers...)

Raise awareness to MEMENTO

Between falez and the cemetery: SOCIO-ECONOMIC LINKAGE

Considering the tight / crowded neighborhood texture between Tibbiye Caddesi and the residents of the cliff, to accelerate the ecological flow, to increase the ecological contribution on human scale, to make regional planting to improve the welfare of the neighborhood.

The principles of centralization and dispersion were employed to establish inter-neighborhood connections within the project area. The concept draws inspiration from biological networks, where cells serve as key points in sustaining neighborhood culture. Axons function as landscape lines, linking cells to neighborhood focal points through nodes. Nodes, or secondary focal points, act as intermediaries that slow down and intensify the transmission of connections, facilitating pause, observation, and engagement with the urban landscape. These nodes also serve as identity markers, reinforcing the sense of place for both residents and visitors. These “lateral focal points” form an interwoven cultural network, enhancing both the social and aesthetic experience of the city. Within this framework, İmrahor Square, Ayazma Park, and Ayazma Square have been identified as key locations for the implementation phase of the project.

N-ormal Route

İrem Nur Yener

"N-ormal Route" was produced within the scope of Landscape Design 2 carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Nergis Aşar under the title "New Normal / New Old: Rethinking of Neighbourhood Landscape" in the fall semester of 2020-2021.

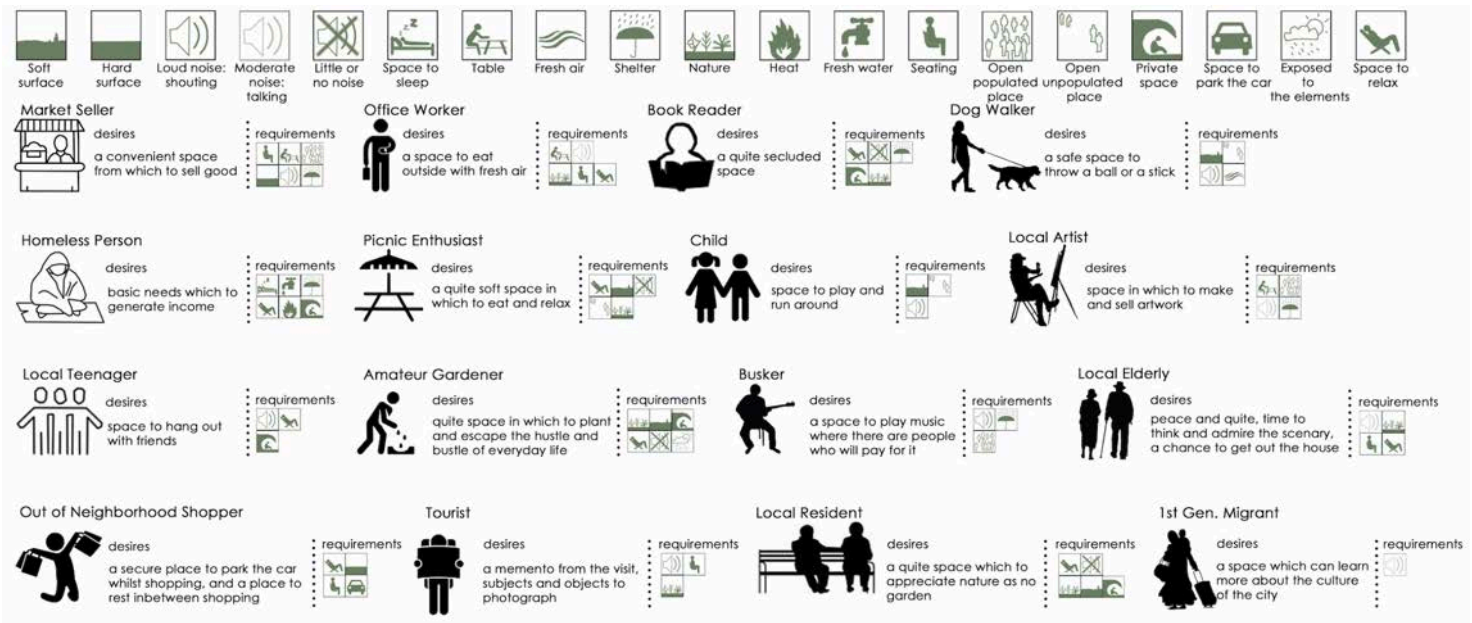

178

Transition from building-life culture to neighborhood-life culture

Adaptation to the polyethnic structure

Transition from the streets to the park for children

Increase in the use of public common space

While individuals shape and transform spaces, they simultaneously preserve and sustain collective memory within them. In other words, the users of a space leave their imprints, embedding their presence into the spatial memory of the environment. In response to this dynamic, I developed a cultural route that integrates local identity, green continuity, and cultural connectivity. To determine the pathways of this route, I conducted a layered analysis, which revealed two distinct paths: The Primary Route & The Secondary Route

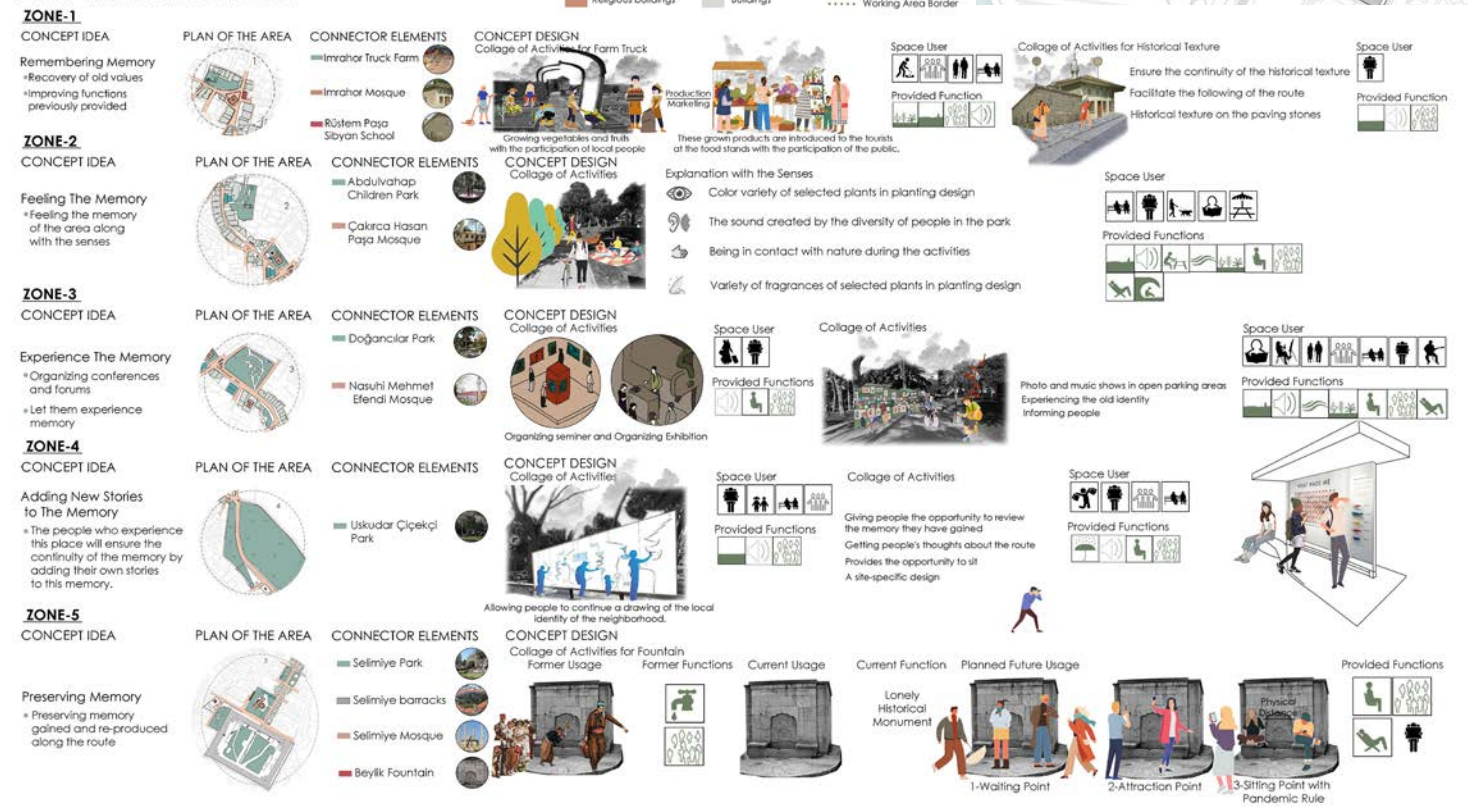

To enhance the understanding of local memory across different timeframes, I structured the Primary Route into five thematic zones, each representing a different phase of engagement with memory:

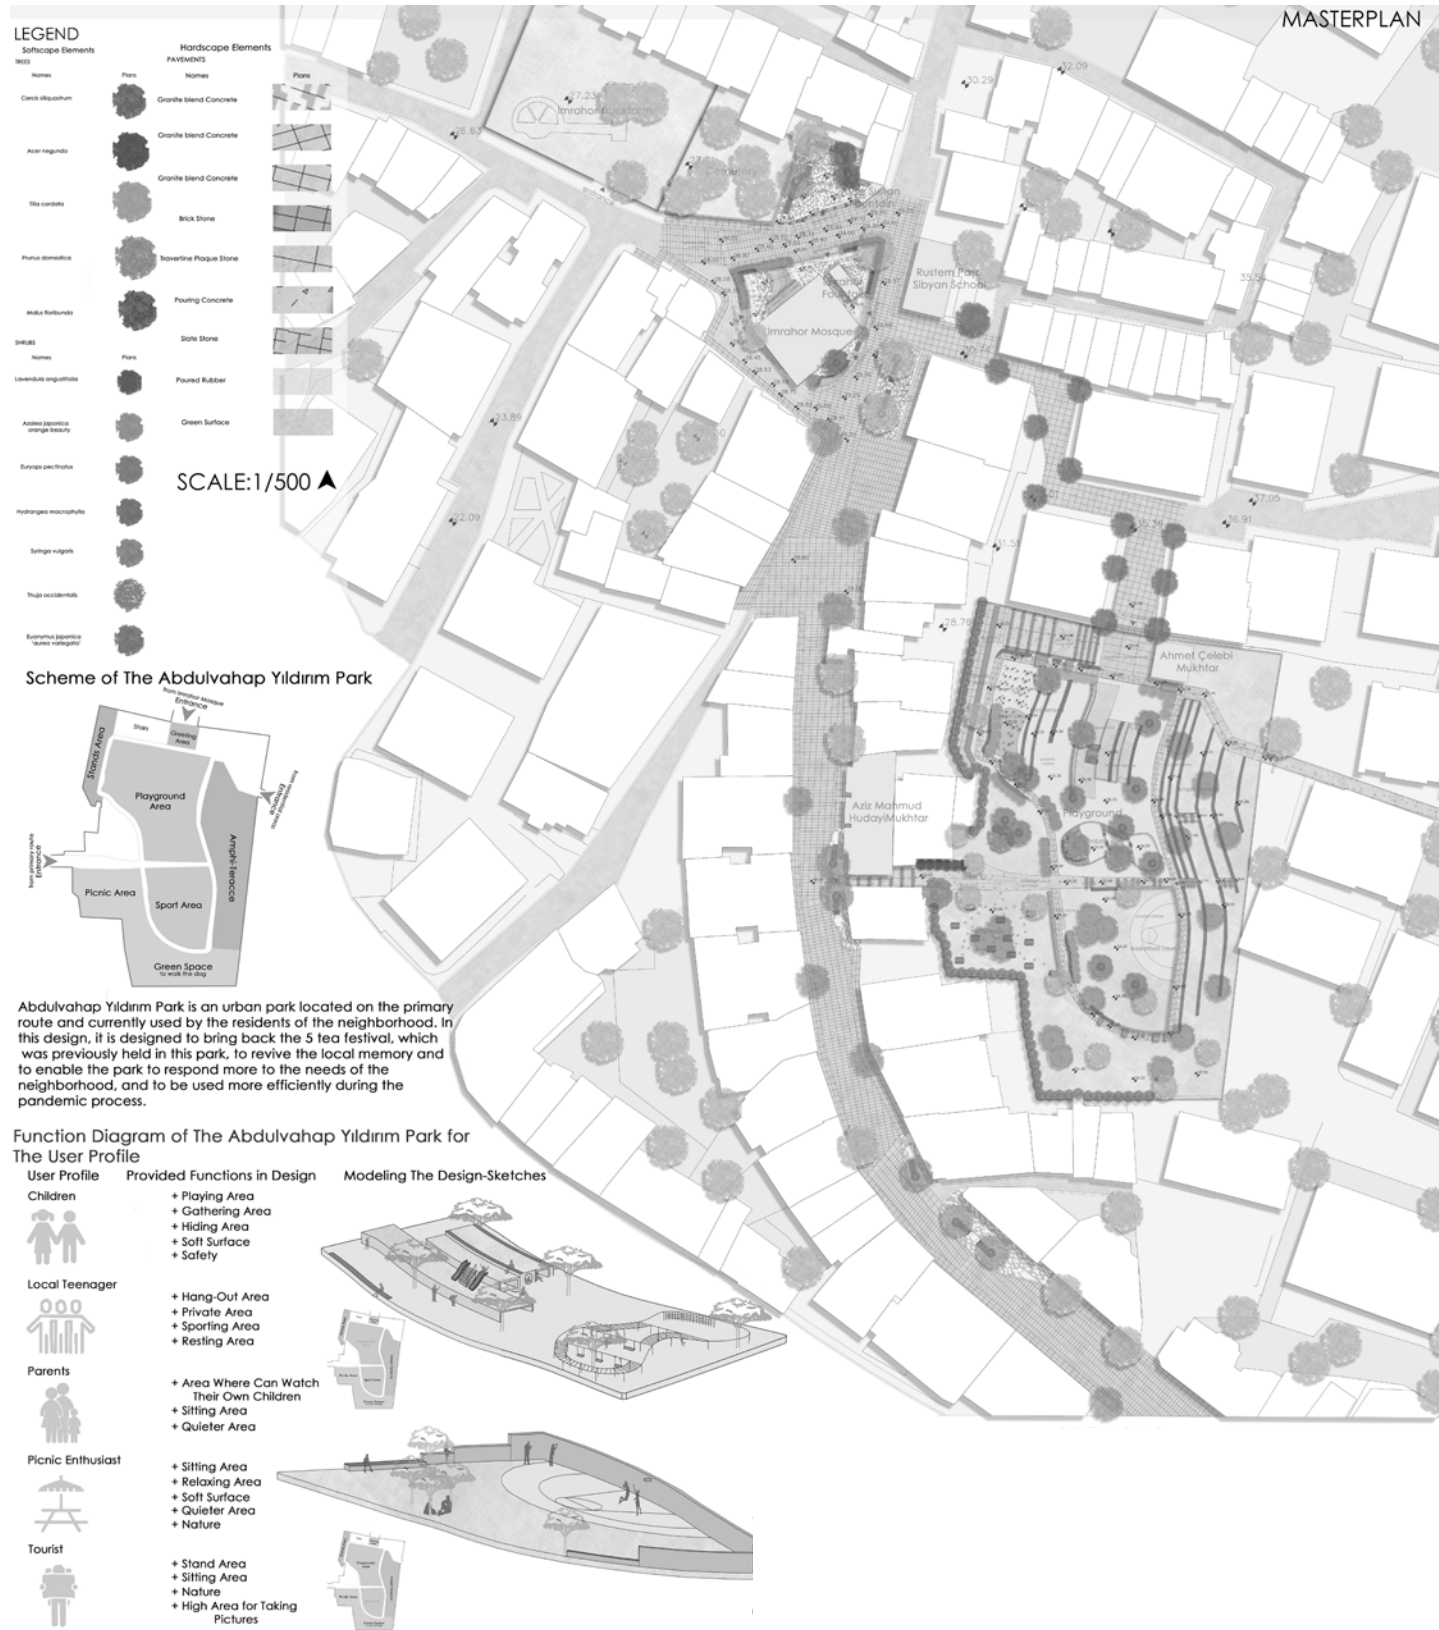

- Remembering the memory
- Feeling the memory
- Experiencing the memory
- Adding new stories to the memory
- Preserving the memory

Over time, neighborhood culture has undergone significant changes. However, these changes are not always reflected in our lived experiences and memories, but rather in the transformation of spaces and means of interaction. While users leave traces of their presence, contributing to the memory of a place, today, local memory is at risk of degeneration and erasure. An analysis of green spaces within the neighborhood revealed that existing green areas are both insufficient and poorly defined. The limited amount of greenery dispersed throughout the urban fabric lacks coherence and fails to establish a meaningful ecological and social network. This project, therefore, seeks to revitalize and reconnect fragmented green spaces, reinforcing both the cultural and environmental fabric of the neighborhood.

Layers of Büyükada

Hande Beril Küçükler

"Layers of Büyükada" was produced within the scope of Landscape Design 2 carried out by Assoc. Prof. F. Ayçim Türer Başkaya and Res. Assist. Başak Akarsu under the title "Discovering Büyükada: From climate change to wildfire" in the fall semester of 2021-2022.

HISTORICAL BACKGROUND OF BÜYÜKADA

SITE ANALYSIS

ISLAND ECOSYSTEM AND THREATS INTERVIEW WITH LOCALS

"Fish and crustacean species have **decreased**. By 1978, the lobsters had vanished. They came back in 1996, but the bugs went away in 1978 and never came back. **There are many species that have disappeared and that we have never seen again.** Under the Büyükada ferry port, hundreds of karagöz weighing 2,25 kilograms lived. There is not a single karagöz anymore. 2, 3 months after the waste was thrown, I saw that the **corals** first changed their color and then **died**."

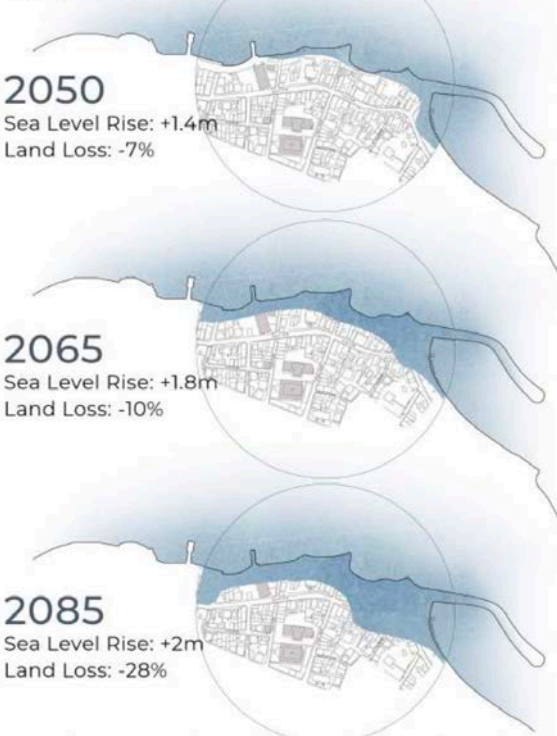

"In the past, when you looked at the sea, you **could see** the types of fish without going into the sea. The boats would go towards the places where the **seagulls** were. Because there was a lot of fish there. Fish had a **chance to live**, too."

"The average lifespan of corals was 60 to 70 years. Corals died due to **excavation and spillage of waste**. If we can create a protected area here, **we can protect all marine animals for the future**."

Ocak, H., (2018). 'Denize borçluyuz', Cumhuriyet Gazetesi, Interview.

TEMPERATURE CLIMATE IMPACT PROJECTION

DESIGN STRATEGIES

CIRCULATION DEVELOPMENT

- + SIDEWALKS
- + BIKE LINE
- + SERVICE ROAD

the existing site lacks accessibility and walkability. There should be different ways to develop a circulation system within the site. Sidewalks and bike lanes connect the site to the surrounding housing and recreational programs.

THEMATIC GARDENS

The thematic garden allows people passing by to form a memory of smell belonging to Büyükada.

EXHIBITION AREA

This exhibition area is defined between two green spaces. It creates a nice venue for temporary exhibitions on Büyükada.

VIEW HAMMOCK

This area offers people both a more comfortable resting area and a viewing opportunity.

The studio focused on investigating and exploring the ecosystem of Büyükada, particularly in relation to climate change and wildfires. The primary objective was to develop environmentally conscious design approaches while understanding the concept of resilience, considering the island's local characteristics, multicultural identity, and ecological vulnerability.

As a starting point, the various layers of Büyükada's landscape were examined through a series of analytical techniques, including site surveys and field excursions. These methods enabled a comprehensive understanding of the island's natural and cultural dynamics, serving as a foundation for designing adaptive and sustainable interventions.

There is very limited historical information regarding pre-Byzantine settlements on Büyükada. One of the most significant antiquities discovered on the island was a collection of gold coins belonging to Philip II of Macedon, father of Alexander the Great. This treasure, consisting of 207 gold coins, was unearthed in 1930 near the Greek Orthodox cemetery in Karacabey and is currently housed in the Istanbul Archaeology Museum.

HERBACEOUS PLANTS SLICED DIAGRAM

NΔ

During the Byzantine era, similar to the other Princes' Islands, Büyükada became well known for its prisons and monasteries. Over seven centuries of Byzantine rule, political and religious conflicts, particularly throne struggles, led to the exile and torture of numerous princes, princesses, and religious figures on the island.

A month and a half before the Ottoman conquest of Constantinople, Fatih Sultan Mehmed's naval commander, Baltaoğlu Süleyman Bey, besieged Kınalıada, Burgazada, and Heybeliada. Due to its fortified castle, Büyükada managed to resist for a short period before eventually surrendering. Following the Ottoman conquest, the islands experienced a period of peace and stability. The local population primarily engaged in fishing and agriculture, while monks residing in monasteries and churches sustained themselves by producing handmade religious artifacts.

The Büyükada Gülistan Street Park Project seeks to develop a comprehensive design proposal for the efficient and sustainable

use of the island's coastline. The project follows a strategic design approach built upon three key elements:

- Shoreline Management - Ensuring the long-term resilience and sustainability of the coastal area.
- Multifunctional Open Spaces - Creating versatile public spaces that serve the community's social, cultural, and ecological needs.
- A Public Circulation System - Establishing accessible and interconnected pathways that enhance community engagement while reconnecting critical ecological zones along the shoreline.

The ultimate goal of this proposal is to enhance ecological diversity while providing a well-integrated and aesthetically pleasing coastal environment. Recognizing the vital role of coastal ecosystems for future sustainability, the project aims to balance human activity with ecological preservation, ensuring that Büyükada's natural and cultural heritage remains protected for generations to come.

PLANT LEGEND

Cultural Network and City Garden

Tuğba Kurt

“Cultural Network and City Garden” was produced within the scope of Landscape Design 2 carried out by Assoc. Prof. F. Ayçim Türer Başkaya and Res. Assist. Başak Akarsu under the title “Discovering Büyükaada: From climate change to wildfire” in the fall semester of 2021-2022.

Opportunities for social interaction on the island are limited, making it essential to create spaces that foster community engagement. This project aims to enhance socialization among adults and children while promoting awareness of sustainability and recycling. To achieve this, the proposed parks will integrate urban gardens, encouraging collective participation in both production and social activities. These spaces will also serve an educational function, particularly for children, by reinforcing concepts of sustainable living and environmental responsibility. A key component of the project is the visualization of carbon dioxide emissions from different flooring materials and coatings used on Büyükada. Additionally, an interactive digital system will allow visitors to scan QR codes on various plant species to identify their Latin names.

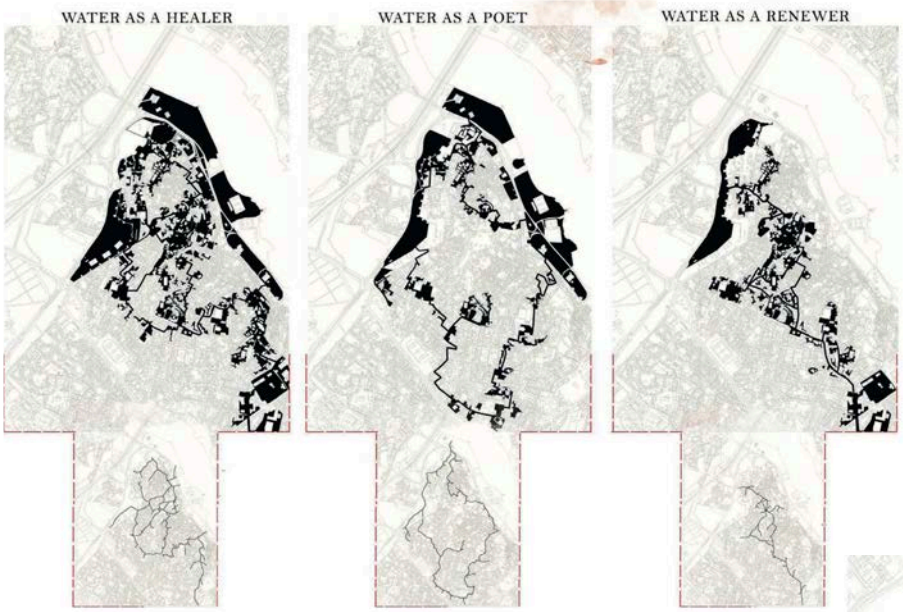

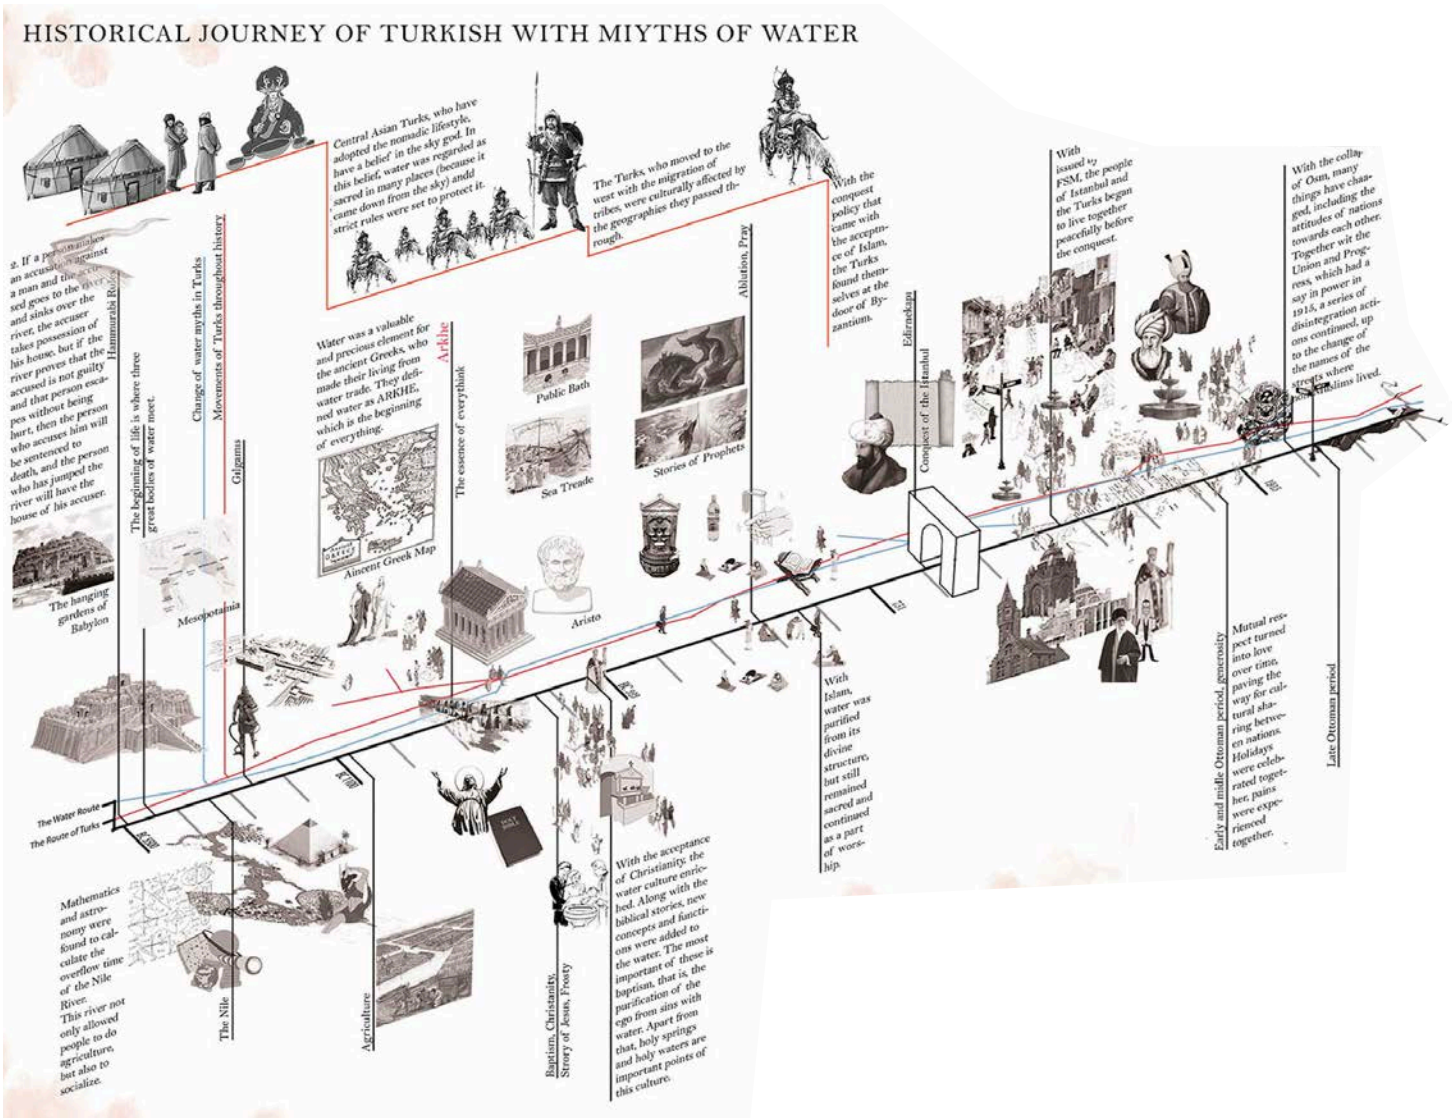

Correct identification will result in energy accumulation, which can then be used to illuminate specific locations on a digital map, enhancing awareness of energy consumption and environmental impact. The project envisions a multi-functional public space, enabling gatherings and celebrations on special occasions while functioning as an exhibition area on other days. The inclusion of urban gardens will support sustainable production and recycling initiatives, and augmented reality (AR) installations will enhance engagement by offering interactive experiences in the evening hours. By integrating technological innovation with ecological awareness, this initiative seeks to foster experiential learning, strengthen community ties, and contribute to the island's cultural and environmental sustainability.

Water as a Healer

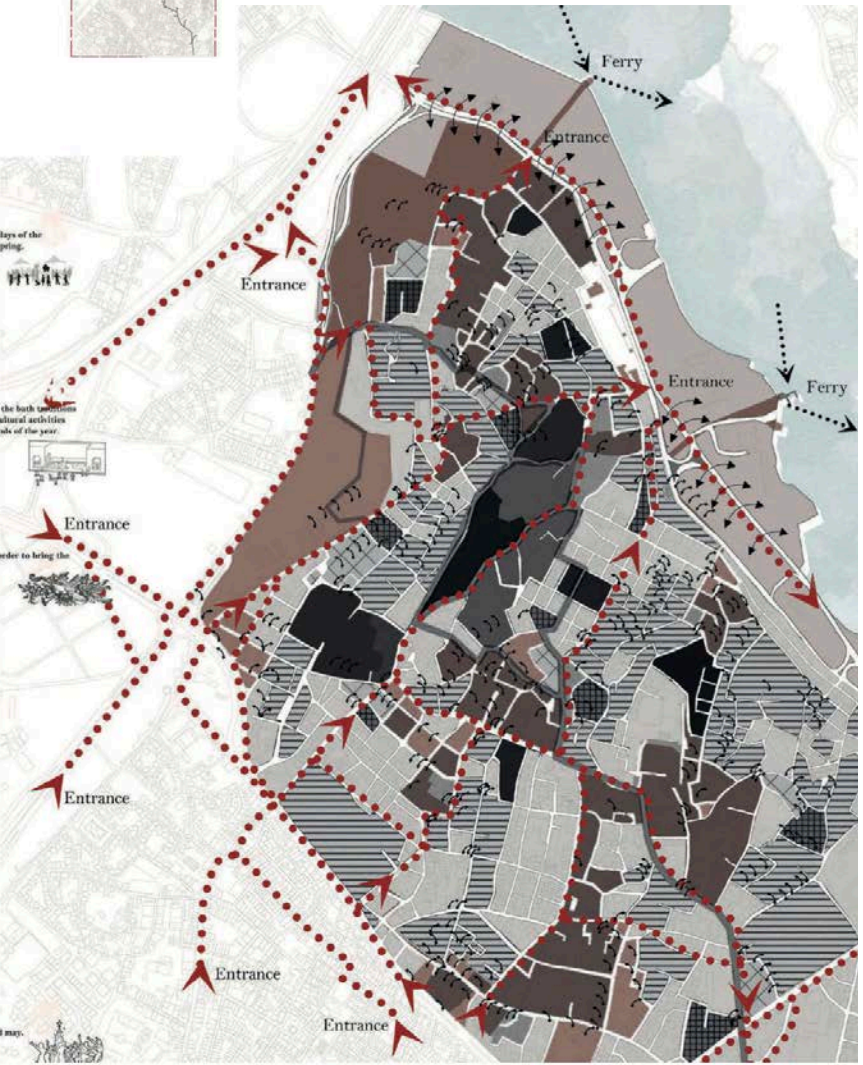

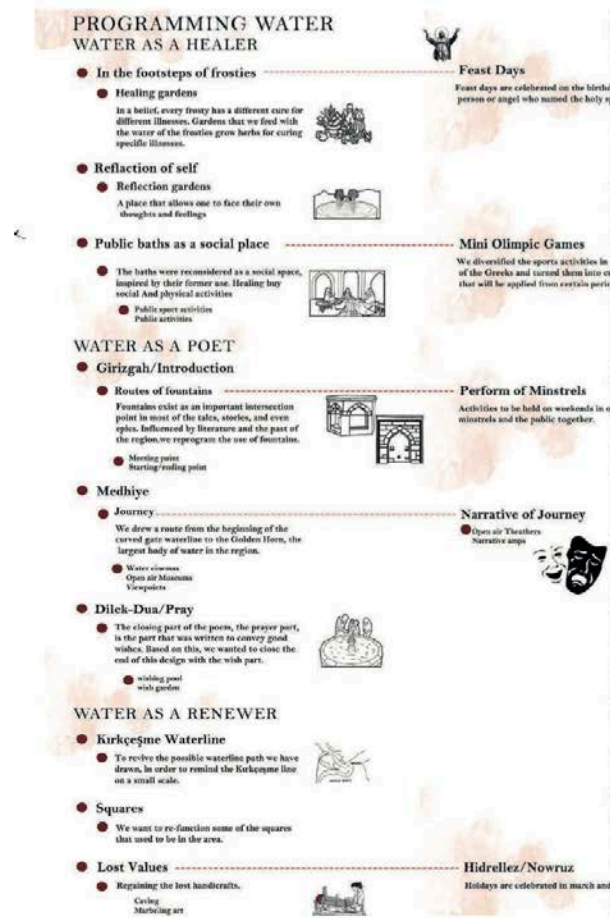

Rebeka Kayakoparan

"Water as a Healer" was produced within the scope of Landscape Design 2 carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Arzu Güler under the title "Treasure Hunt: Finding the Lost Traces of Water" in the fall semester of 2021-2022.

In the Aynasaray Project, we explored the cultural significance of water, shaped by the interaction of Turkish traditions with diverse cultures from Central Asia to Anatolia. Drawing from water legends, history, and literature, we analyzed its distribution from Eğrikapı to fountains, using its path to shape future routes.

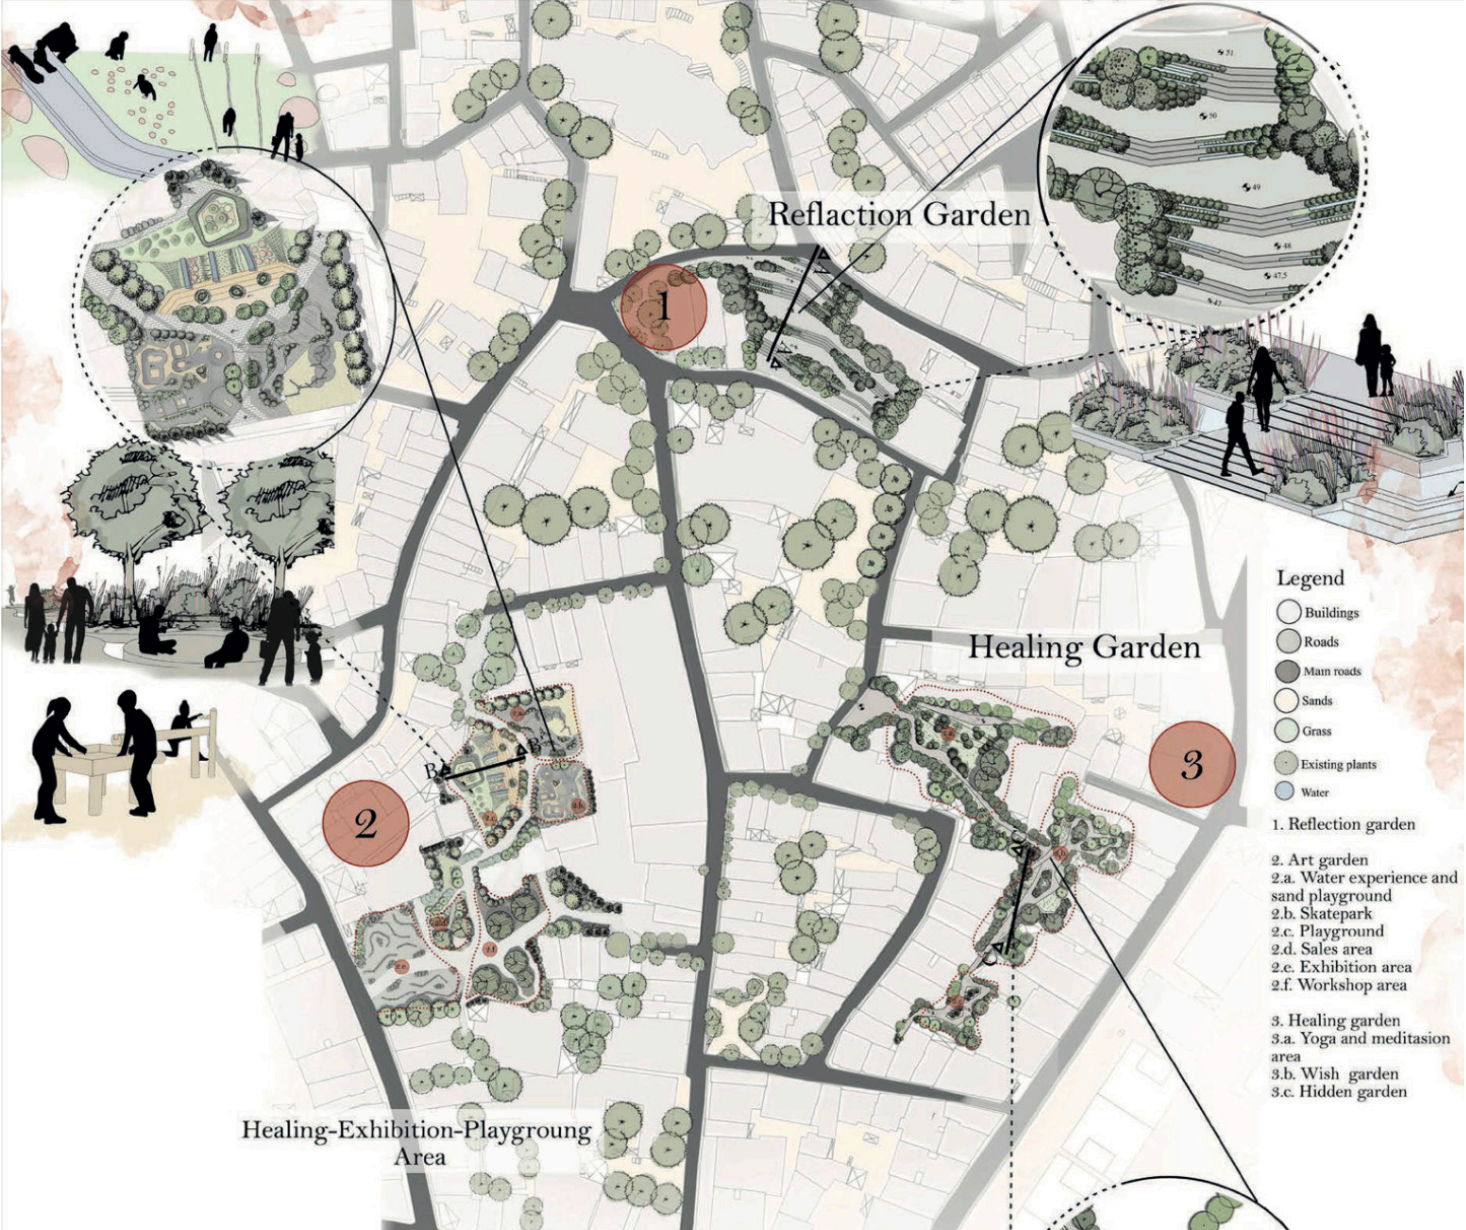

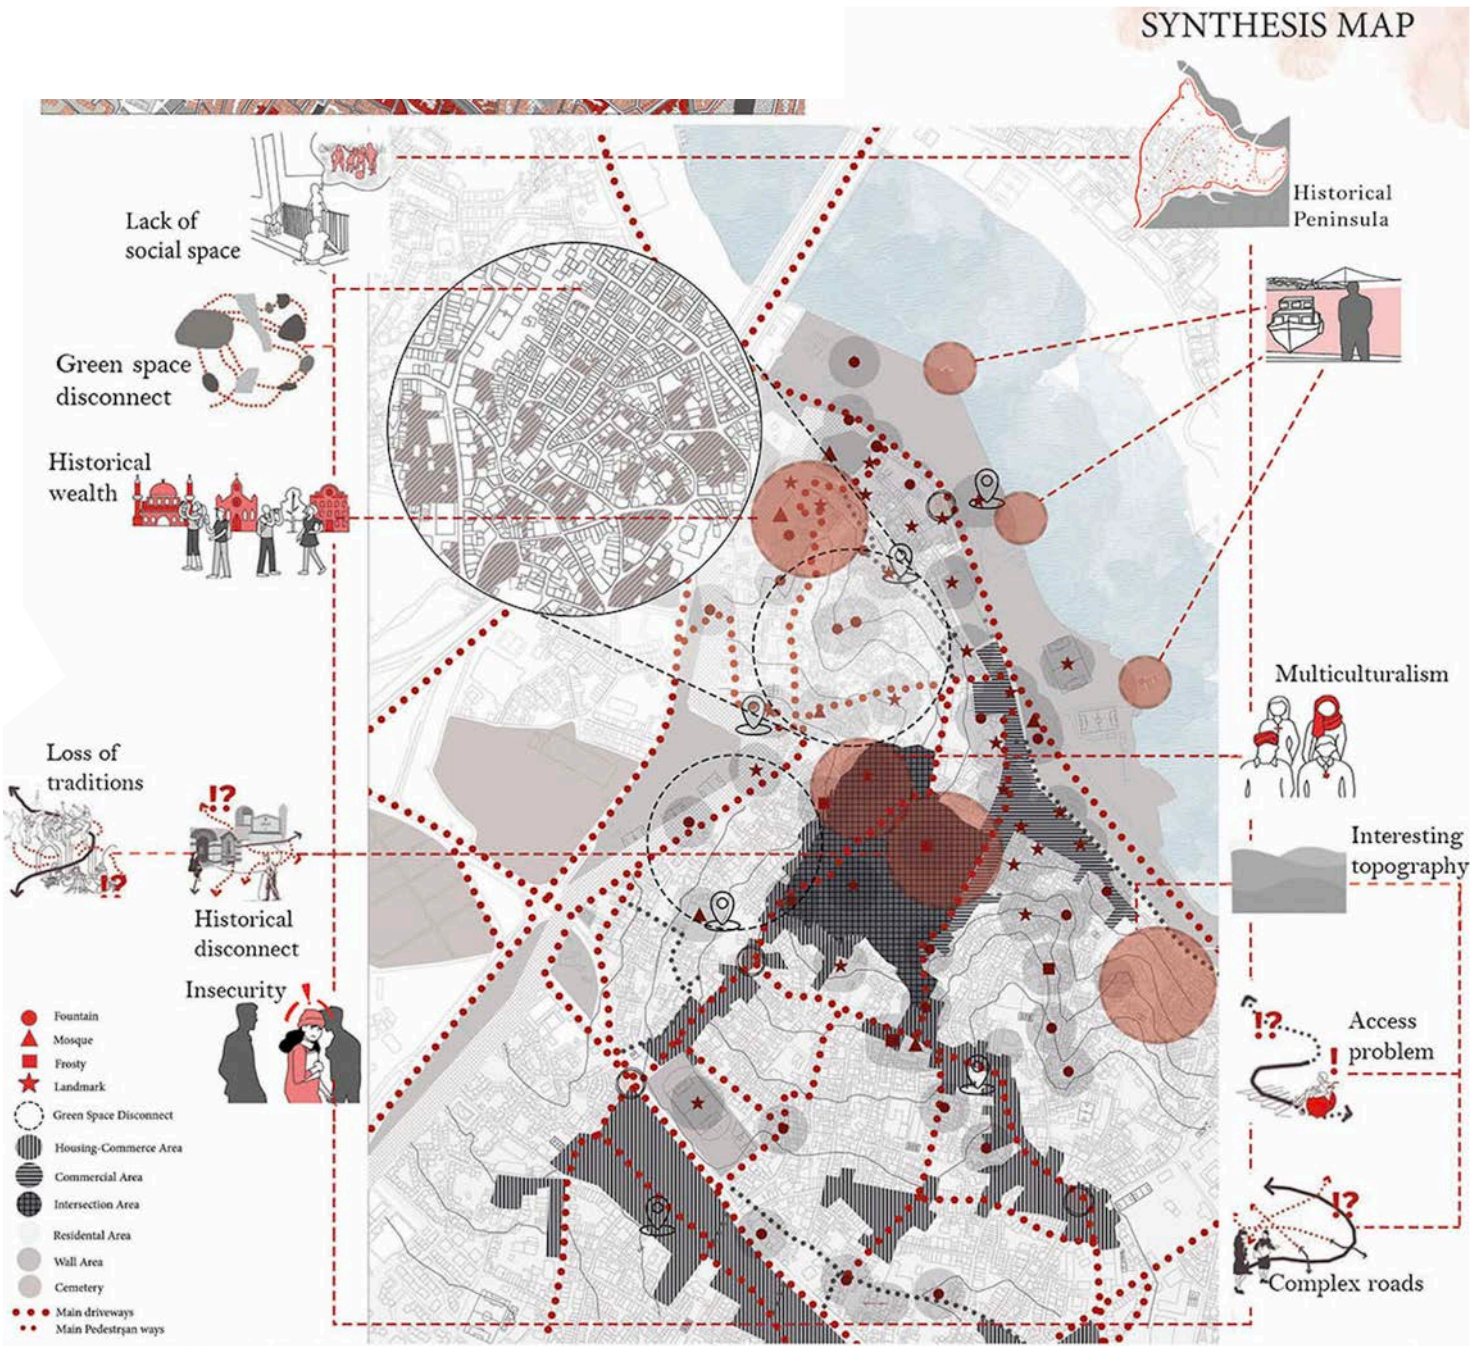

Examining water as a renewing, poetic, and healing force, we developed the "Healer Route" by integrating fountains, landmarks, roads, and green spaces, emphasizing its restorative and cultural role in the urban landscape.

The Poet's Route was derived from an analysis of fountains, spatial usage, evacuation corridors, green areas, roads, and protected zones, while the Regenerative Route emerged from studies on Pervitich maps, fountains, the Curvikapı waterway, roads, and green spaces. The integration of these routes informed the new land use and functional zoning. Key zones include the Healing Zone, originating from the Healer Route, along with a Reflection Zone, Hammam and Mini Olympic Zone, and Holy Spring Fair Zone. The Poet's Route contributes to the Fountain Zone, Journey

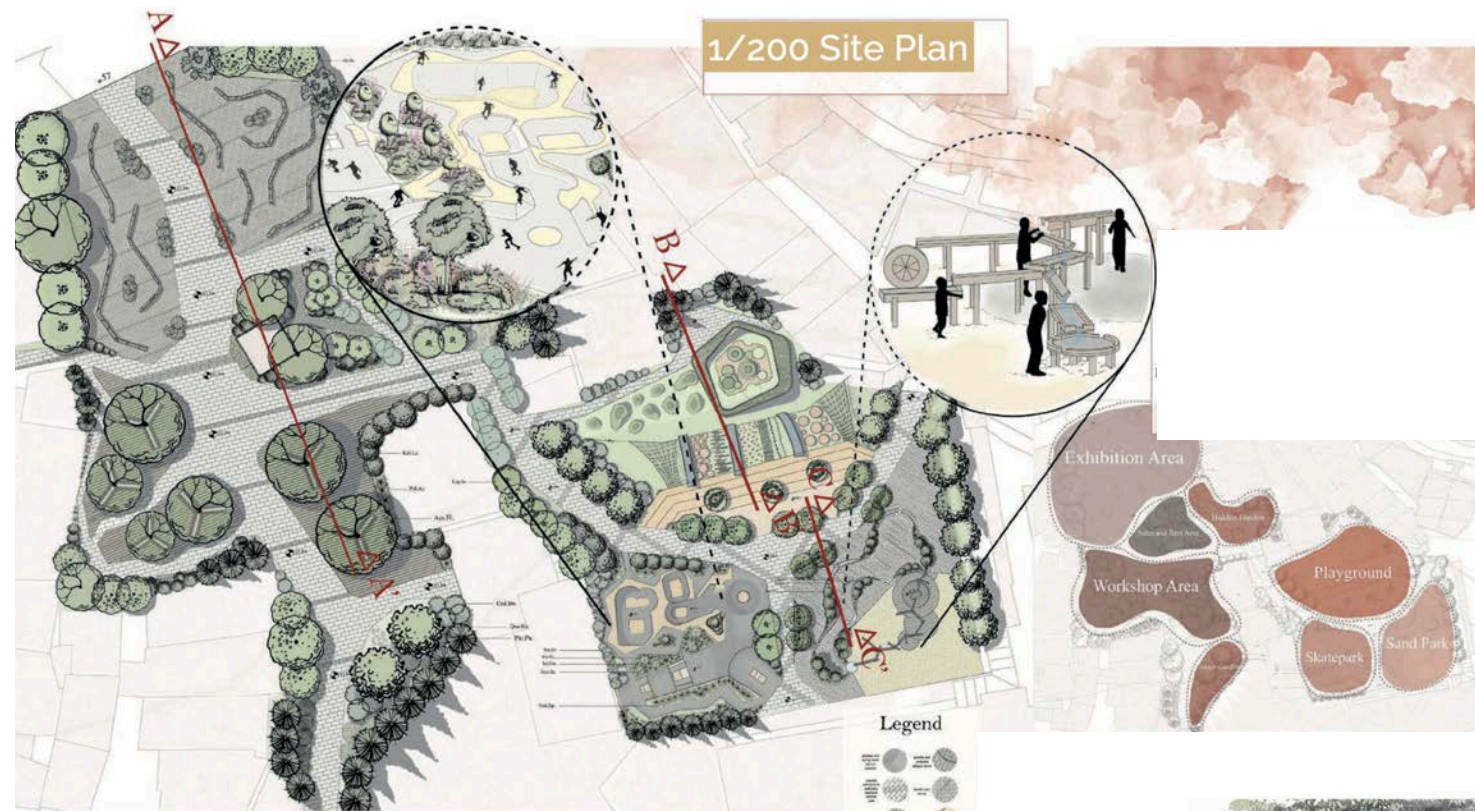

Zone, and Narrator Zone, while the Renewer Route shapes the Art District, Kırkçeşme District, Square District, and Hidirellez/Nevruz District.

From these analyses, three focus areas were developed: the Healing Garden, Reflection Garden, and Art Garden. Existing vegetation was preserved, complemented by new plantings serving functions such as shade, aesthetics, privacy, screening, guidance, and rainwater management.

The central theme of the project is to utilize water's healing properties within this area. Analysis has shown that water has been used for therapeutic purposes across various cultures throughout history. This project aims to address multiple issues in Ayvansaray by leveraging water's restorative qualities.

The Healing Garden is designed as a sanctuary where residents can find peace and rejuvenation. Additionally, it addresses Ayvansaray's lack of green spaces, providing a natural setting for social interaction. The Reflection Garden extends this concept by using water's healing power to promote mental well-being for both people and nature.

200

2021-2022 Fall

This design focuses on recycling and reusing water, one of the most pressing challenges of both today and the future. By utilizing the site's topography and rain gardens, rainwater is collected and recycled, allowing water to heal itself—a core theme of the project. Additionally, the Reflection Gardens offer a tranquil environment, enriched by the aesthetic and sensory impact of the landscape.

The Art Garden is designed as a space where water-based art forms, such as marbling (Ebru), are revived through workshops and exhibitions. This area not only promotes cultural continuity but also enables the sale of handcrafted products created in these workshops.

One of Ayvansaray's major issues is the lack of safe play areas for children, forcing them to play on the streets. The Sloped Playground is designed to integrate seamlessly with the existing topography, creating a natural play space for climbing, jumping, and sliding activities. A skatepark is also included, providing space for skateboards, skates, and bicycles.

The Water Experience Area introduces an interactive space where rainwater is integrated into play and learning. A bioswale system and vegetation filter runoff from hard surfaces, while a sand pool and a water playground offer unique, multi-sensory experiences for children and visitors of all ages.

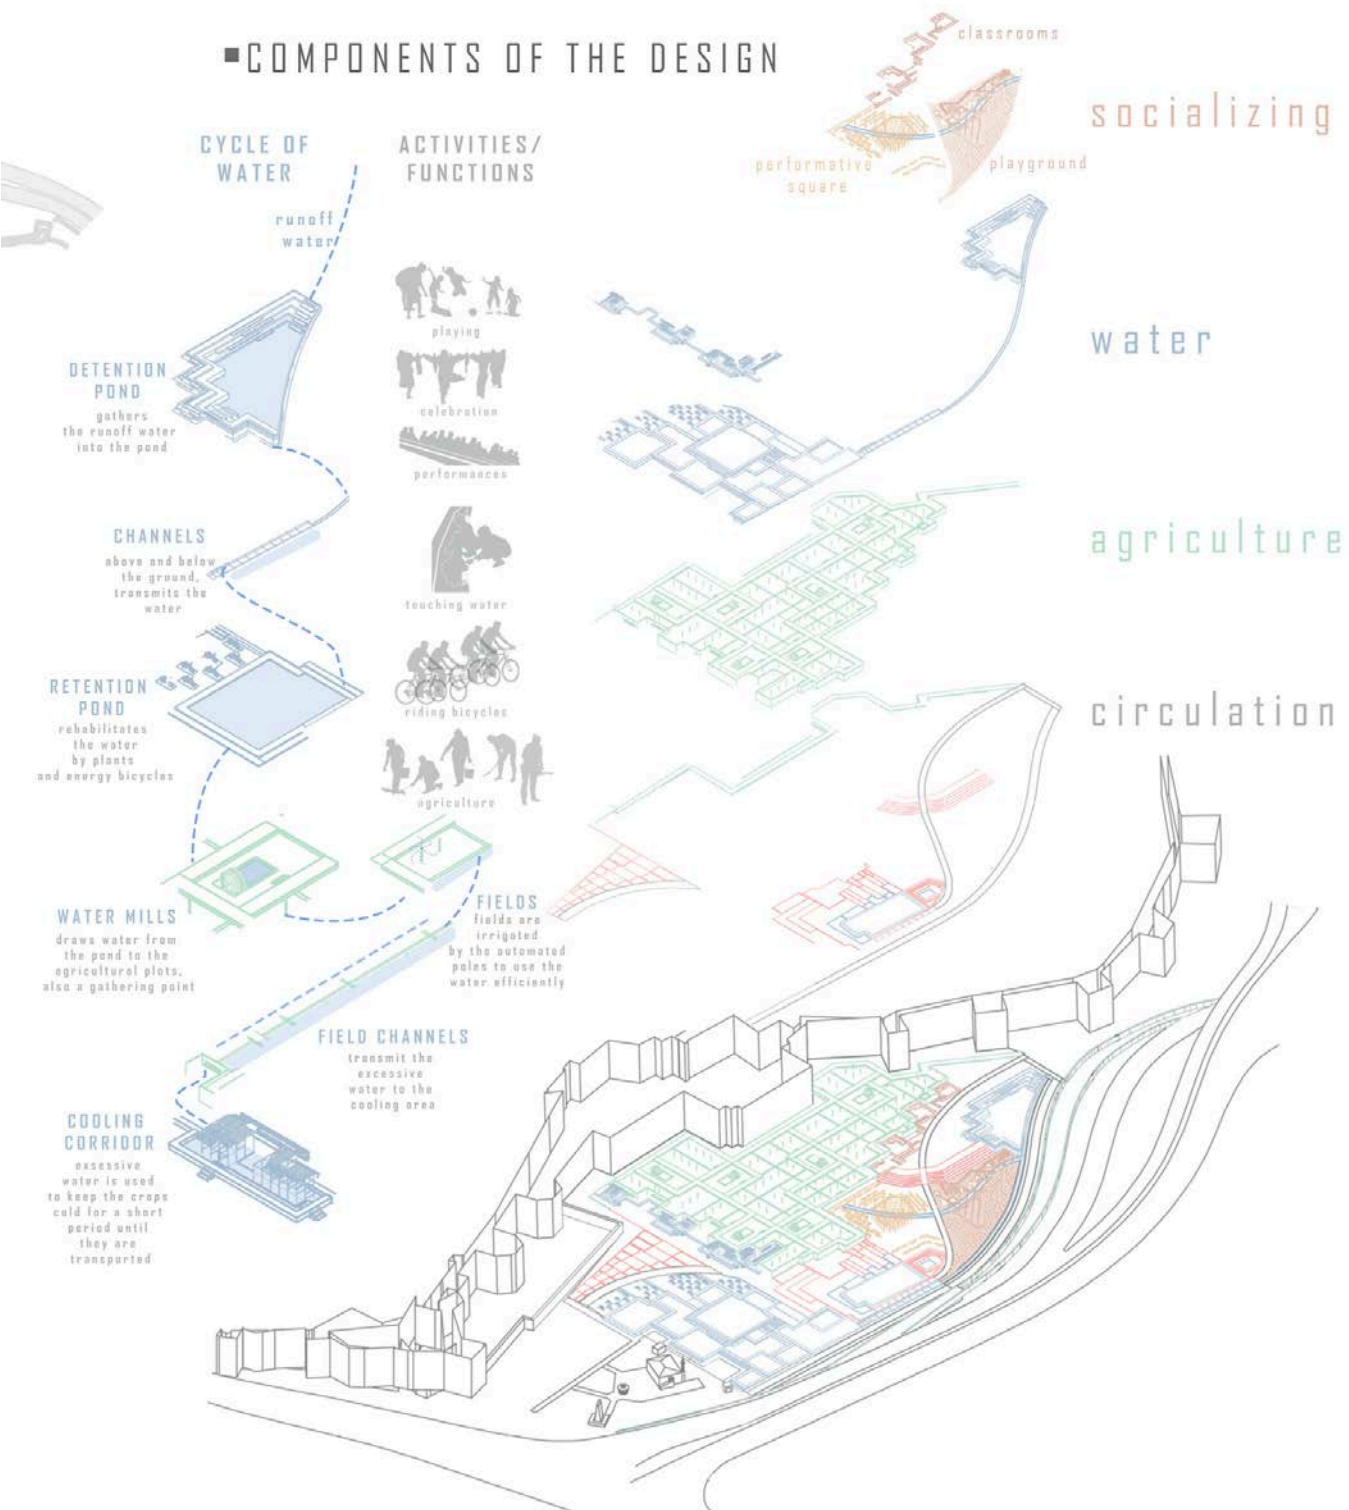

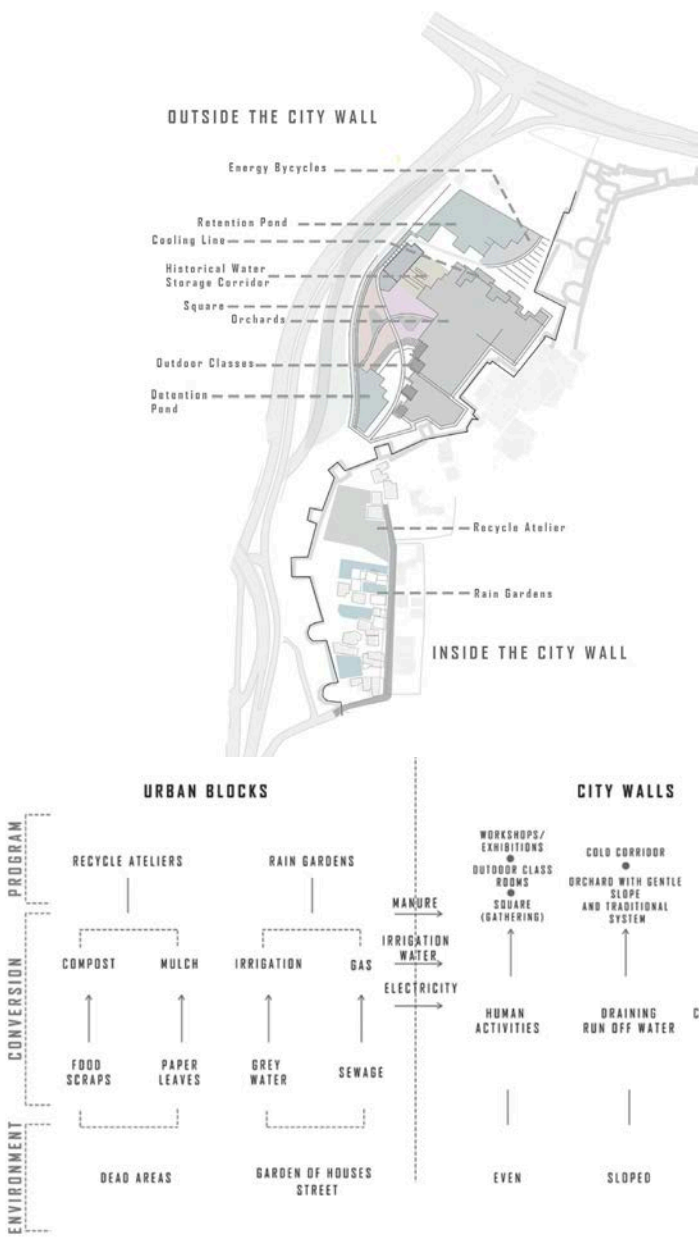

201

LD II / Treasure Hunt

Purifying Ayvansaray

Rabia Ezgi Beyen

“Purifying Ayvansaray” was produced within the scope of Landscape Design 2 carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Arzu Güler under the title “Treasure Hunt: Finding the Lost Traces of Water” in the fall semester of 2021-2022.

Ayvansaray holds a strategic position within the historical peninsula, playing a significant role in various aspects such as Istanbul's minority communities, the city's defense system, maritime connections, transportation routes, and historical water infrastructure. The area is distinguished by its water-related structures, including hammams, fountains, cisterns, ayazmas, mosques, and wells. These elements were once integral to daily life, serving as social and communal gathering spaces. Today, however, many of these historic water structures have fallen into disuse as socialization patterns have shifted. Public spaces like streets and squares—which once fostered communal interaction

■Cooling Corridor

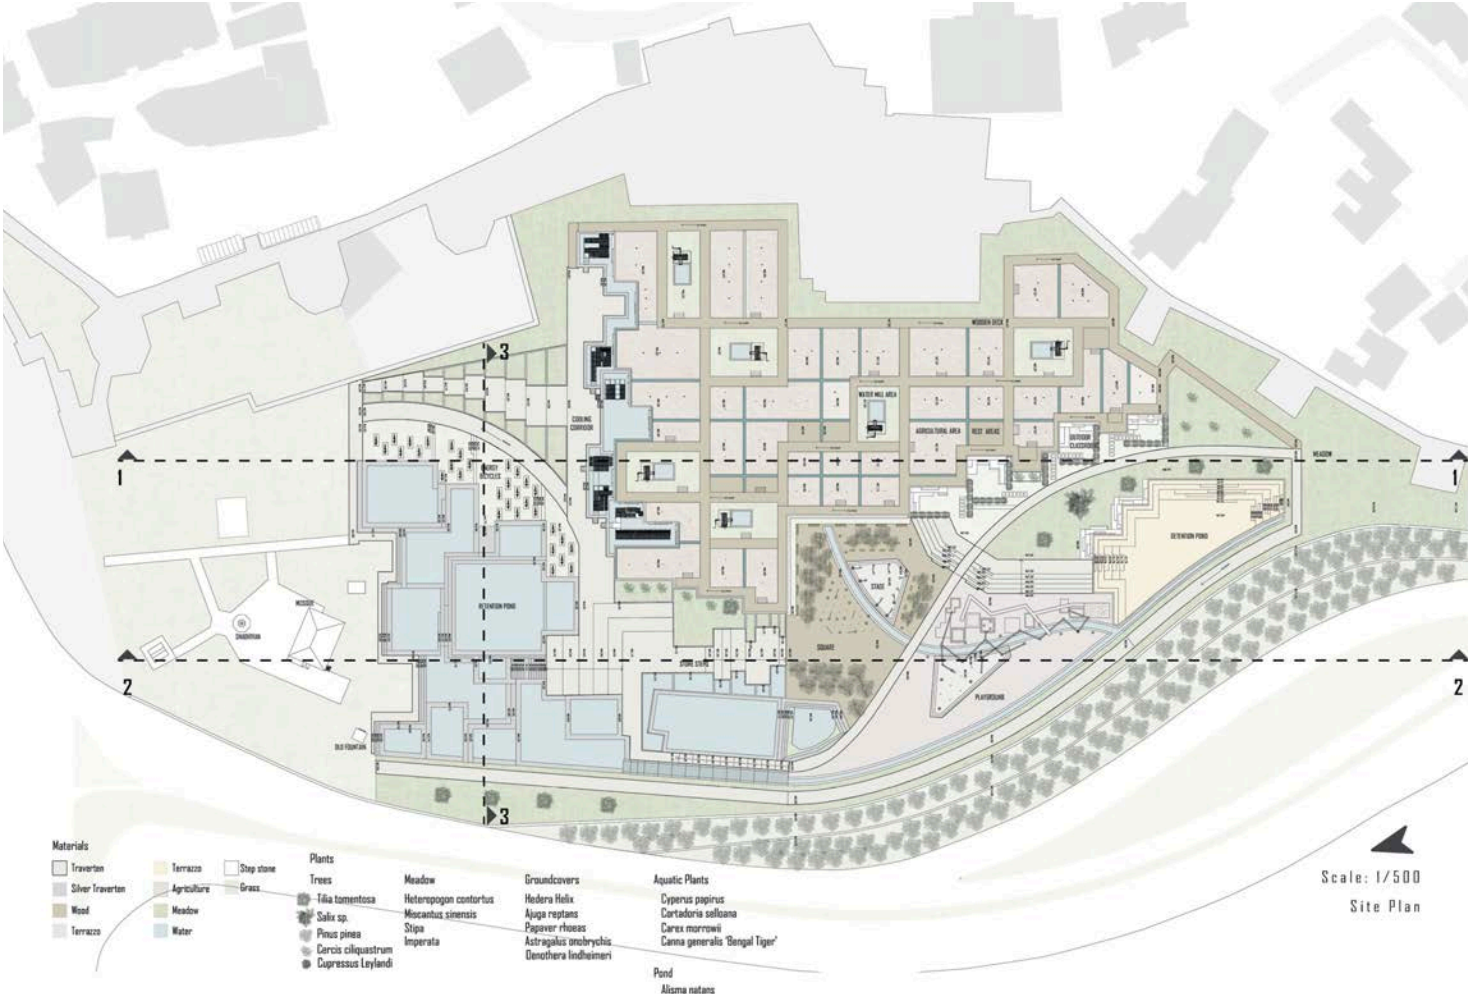

■Energy Bicycles to Purify Water

■ Retention Pond

■ Steps to Square, nearby the old water storage

Four streets have been designated as thematic belts based on the city development plan. My focus was on the area outside the city walls, which, through group discussions, was identified as a potential orchard zone. I further developed this concept into a multifunctional space, designed to serve as both a social and gathering hub for local residents and visitors. Water is the central element in this space, functioning as a medium for community engagement. The orchard consists of several key components, including: Squares for playgrounds and performances, a detention pond for water collection before treatment, a retention pond for

water purification, energy bicycles, allowing public participation in water recycling, a cooling corridor to enhance crop resilience, outdoor landscape classrooms for exhibitions, a bazaar and workshops, a gricultural fields supporting urban farming initiatives. A meandering water channel serves as a spatial guide, integrating different functions within the area. Additionally, trees are planted along the sloped roadside, creating a natural buffer between the orchard and traffic. The retention pond extends to the mosque's fountain, establishing a symbolic and functional connection between historic and contemporary water sources.

■Fields and Water Mill

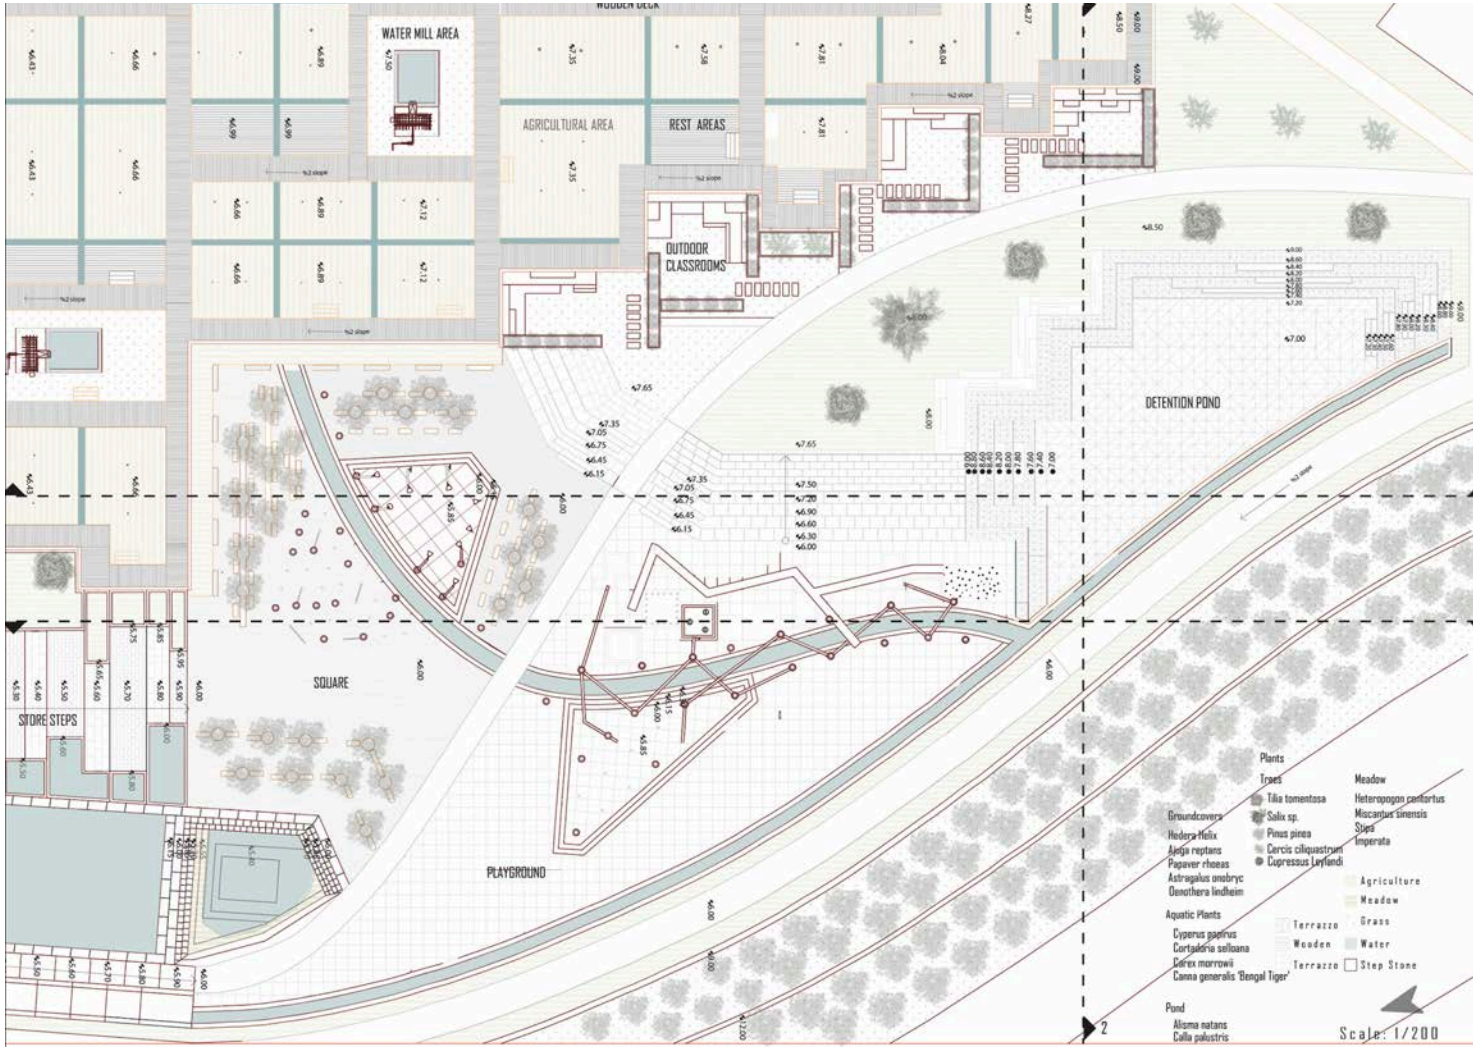

■ Stage

■Water Poles (exhibition area)

■Artificial Topography in the Play Square

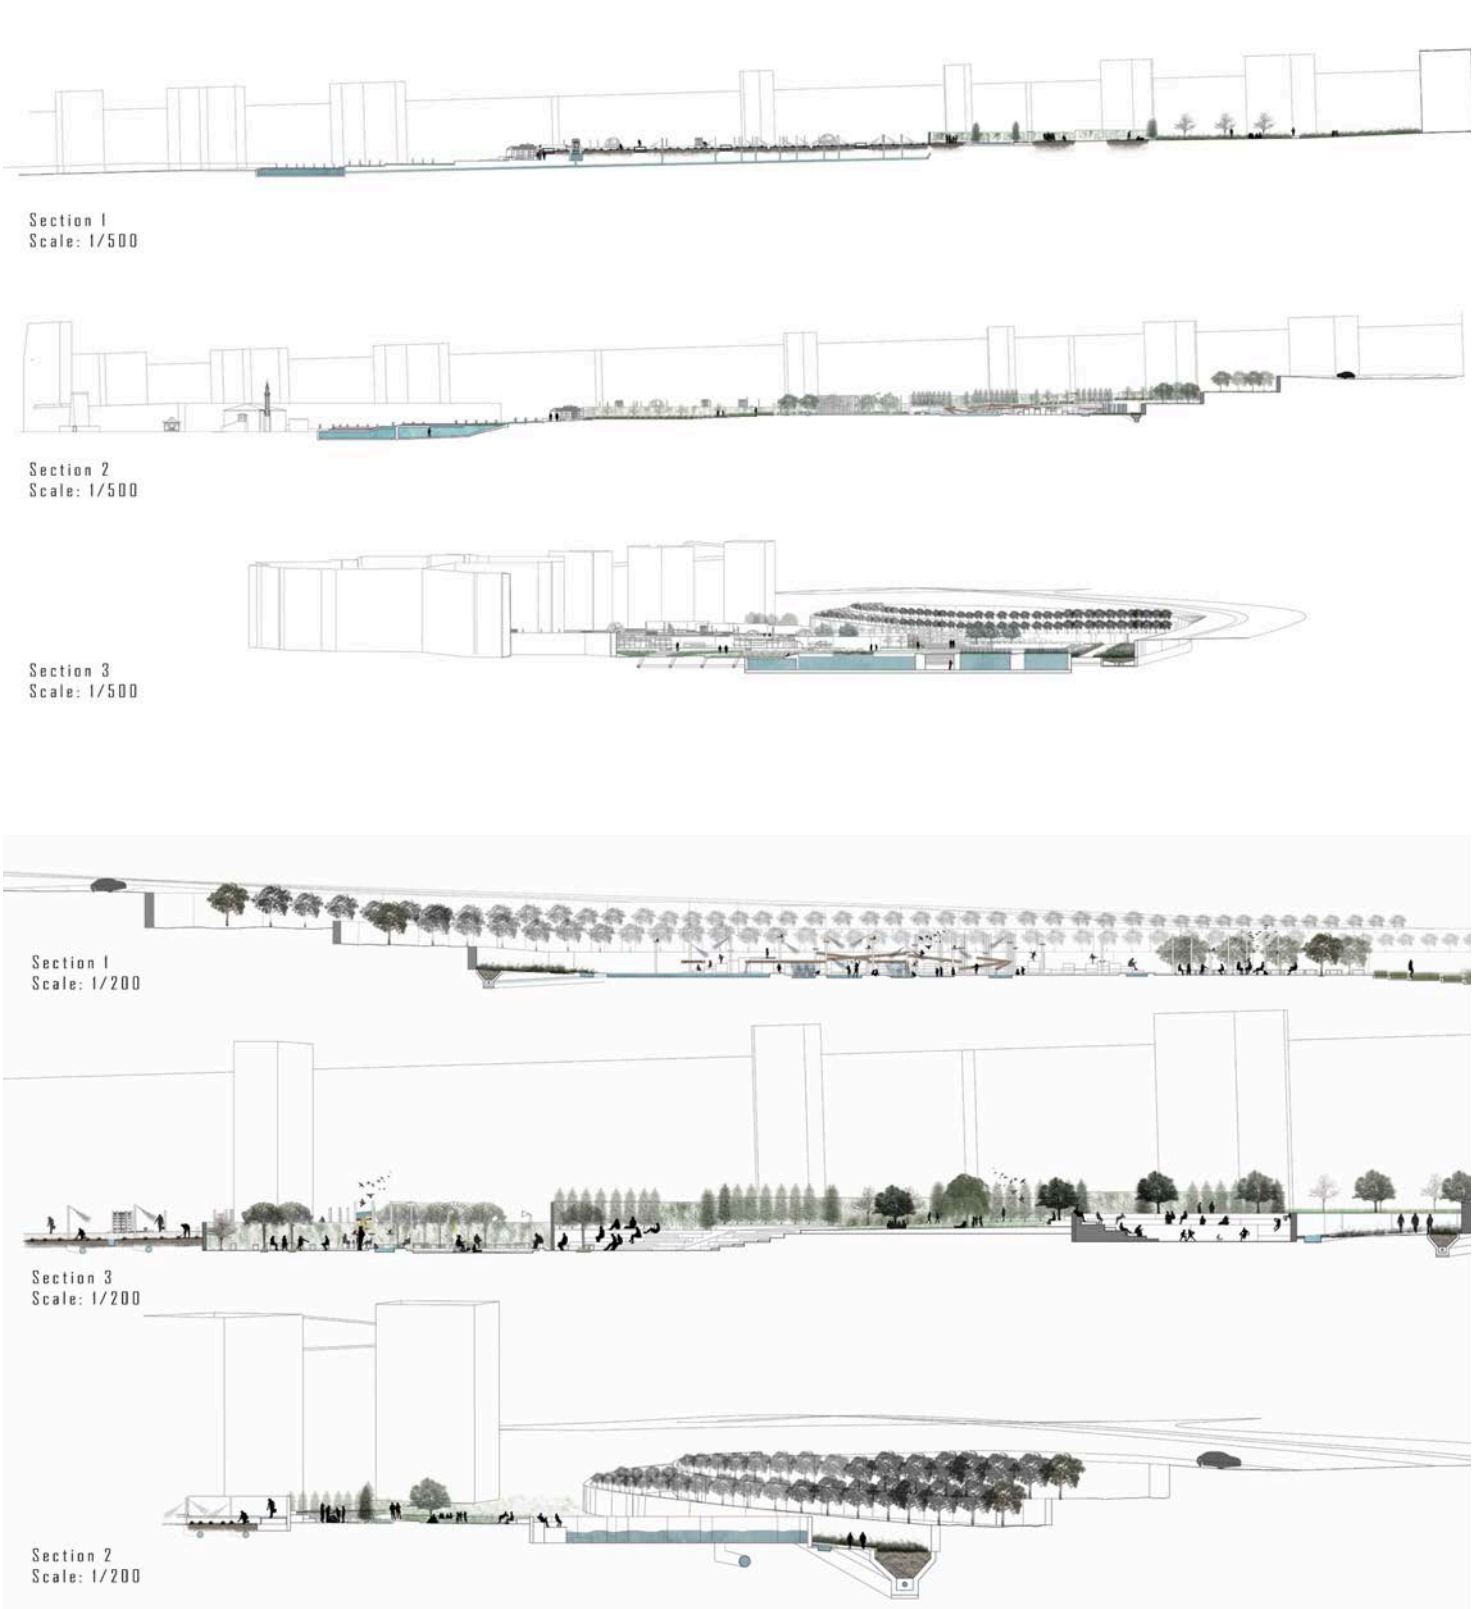

The orchard also maintains a connection with the inner side of the city walls. Available spaces within the neighborhood have been repurposed as rain gardens and recycling ateliers, where food scraps, paper, newspapers, and water are collected and transformed into fertilizers or mulch. This process directly supports the agricultural activities of the orchard.

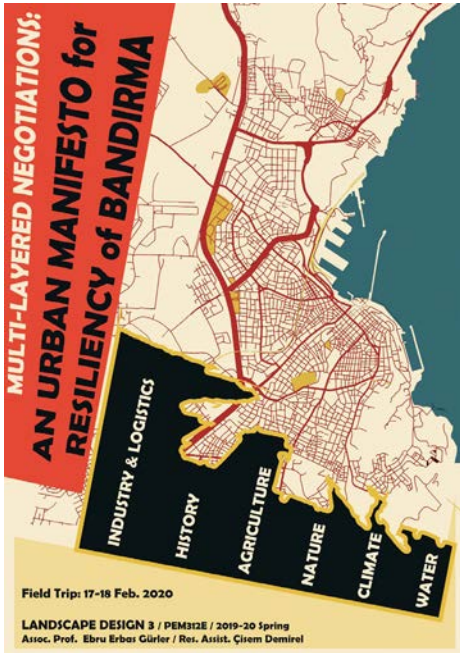

At a 1/200 scale, I designed the square, detention pond, agricultural area, and outdoor classrooms. The outdoor classrooms are open spaces intended for agricultural workshops, specifically to teach permaculture techniques. Their grass-covered surfaces allow for digging and hands-on learning.

Seating steps are provided for observation and instruction. The detention pond, during dry periods, functions as both a playground and a performance/celebration space. To enhance engagement and vibrancy, terrazzo was selected as the primary surface material due to its colorful, durable, and program-appropriate qualities.

The square's playground also features terrazzo flooring, incorporating two contrasting colors to capture attention. One half consists of an artificial topography encouraging physical activity, while the other half integrates interactive water play through operable channels and water poles. On the opposite side of the square, water poles serve dual purposes: an interactive water experience and an exhibition space. The lighting elements, designed in harmony with the water poles, also serve as structures for hanging exhibition materials. Additionally, they incorporate bowls and perches for birds, enhancing biodiversity.

The agricultural area is structured to channel excess water through the topography using slope and strategically placed water channels. Water flows from the fields into the channels, eventually reaching the cooling area, where it helps preserve crops before transport. After serving this function, the water is redirected to the retention pond, ensuring efficient water management and sustainability.

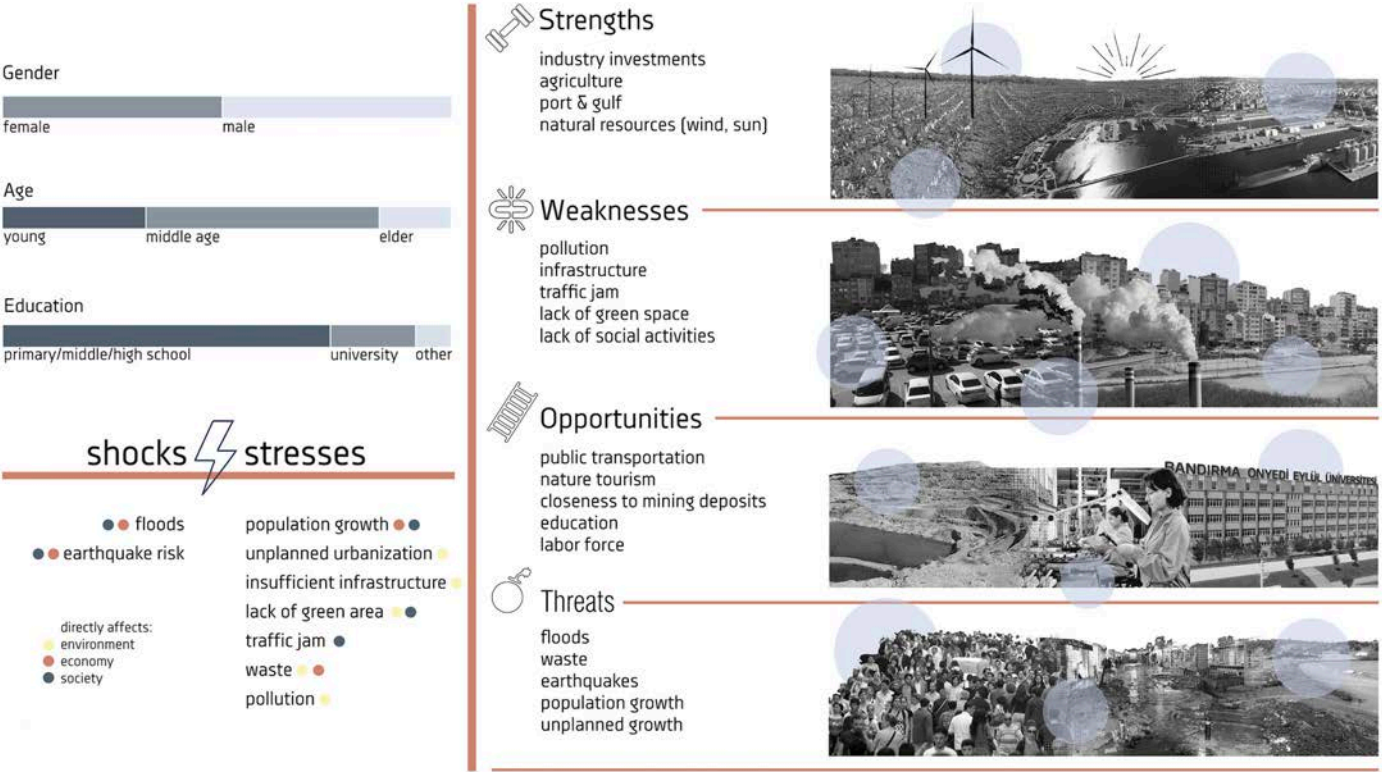

PROJE III LANDSCAPE DESIGN III

Symbiosis

Aylin Önal

"Symbiosis" was produced within the scope of Landscape Design 3 carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Çisem Demirel under the title "Multilayered Negotiations: An Urban Manifesto For Resiliency of Bandırma" in the spring semester of 2019-2020.

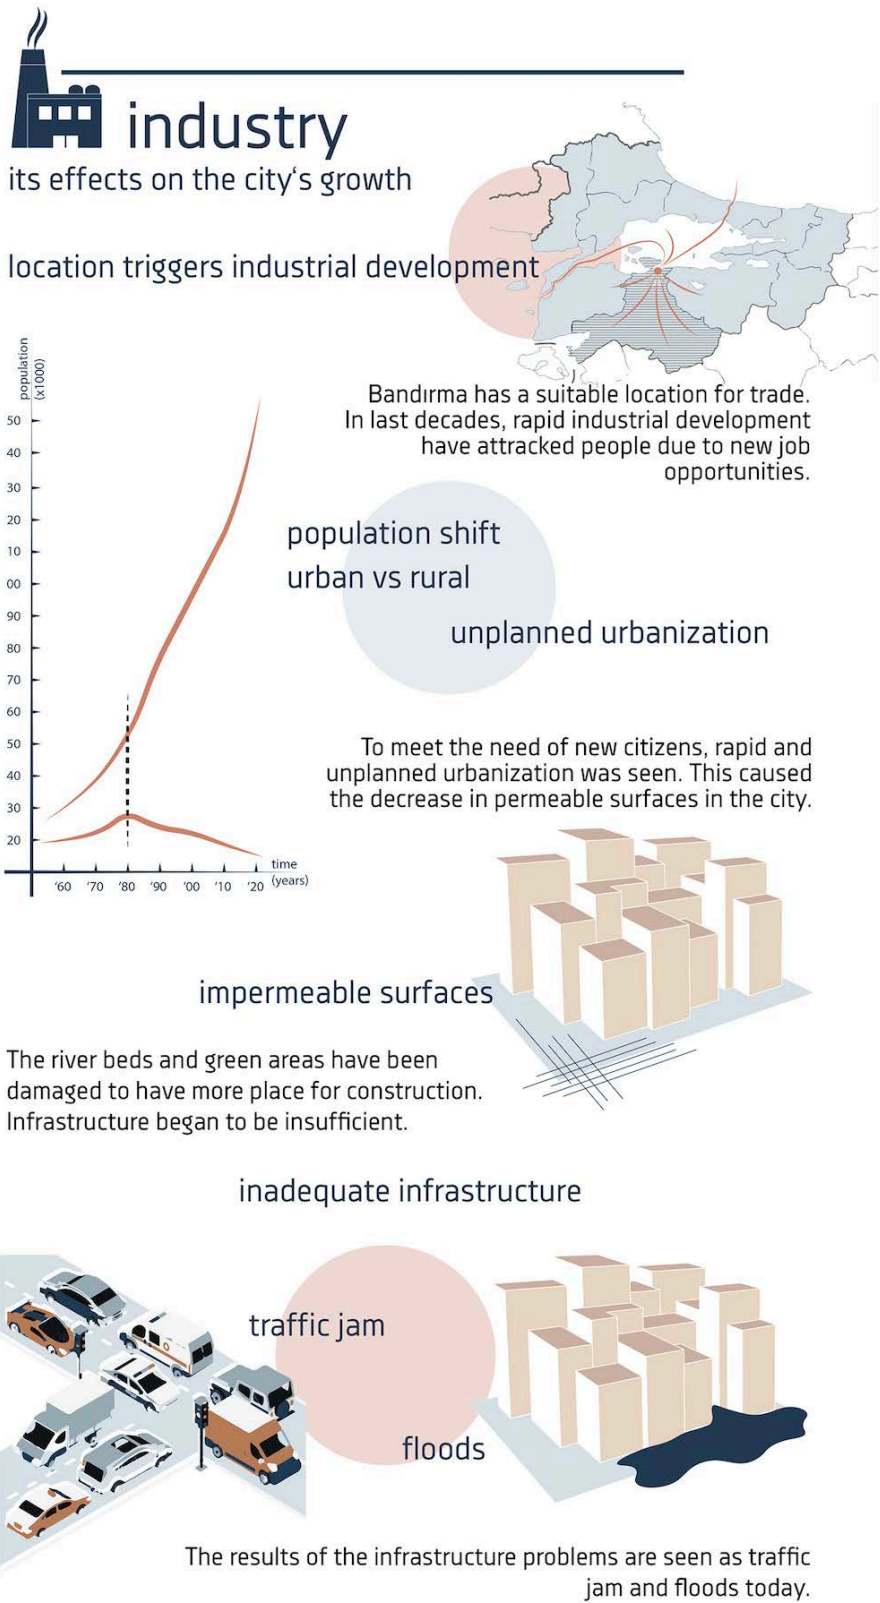

BANDIRMA
general analysis

212

Bandırma is a district with a history dating back thousands of years and is currently experiencing significant urbanization effects. While its location is convenient for transportation, the unplanned growth and typical urban problems have been exacerbated by industrial development. The main stresses affecting Bandırma include population growth, lack of infrastructure, lack of permeable surfaces, traffic congestion, waste, and pollution. Additionally, floods frequently occur after heavy rains.

Future plans for Bandırma emphasize industrial investments. However, without comprehensive resilience strategies, these investments may exacerbate existing problems. Therefore, the main goal of the project is to mitigate the issues caused by industry so far and to establish symbiotic relationships based on mutual benefits among the various elements in Bandırma, including industry. These relationships are divided into three categories: industry-agriculture, industry-society, and society-agriculture.

213

The industry-agriculture relationship is based on the concept of industrial ecology, which involves cycles between the inputs and outputs of production activities. The output of one production process can serve as the input for another, promoting a circular economy and reducing waste.

In the industry-society relationship, the concept of industrial ecology is adapted for public application. Non-hazardous wastes are recycled through collective production and made available for public use. This approach turns public spaces into areas created by the community itself.

The society-agriculture relationship aims to strengthen the rural economy by enabling rural producers to reach urban consumers directly, without intermediaries. This connection helps to support local agriculture and ensures that the benefits of production are shared more widely.

change in social configuration & lifestyle

Migrations caused changes in social configuration & lifestyle such as changing public place usage.

Today, the amount of people working in industry is just 16%. With the further development Bandırma is going to attract more people and the problems are going to be more complicated to solve. The only way for a healthy growth is the sustainable industry which minimizes its negative effects and benefits the city rather than to harm.

There are huge investments for industrial development in Bandırma and it is aimed to be one of the most significant industrial cities in the region.

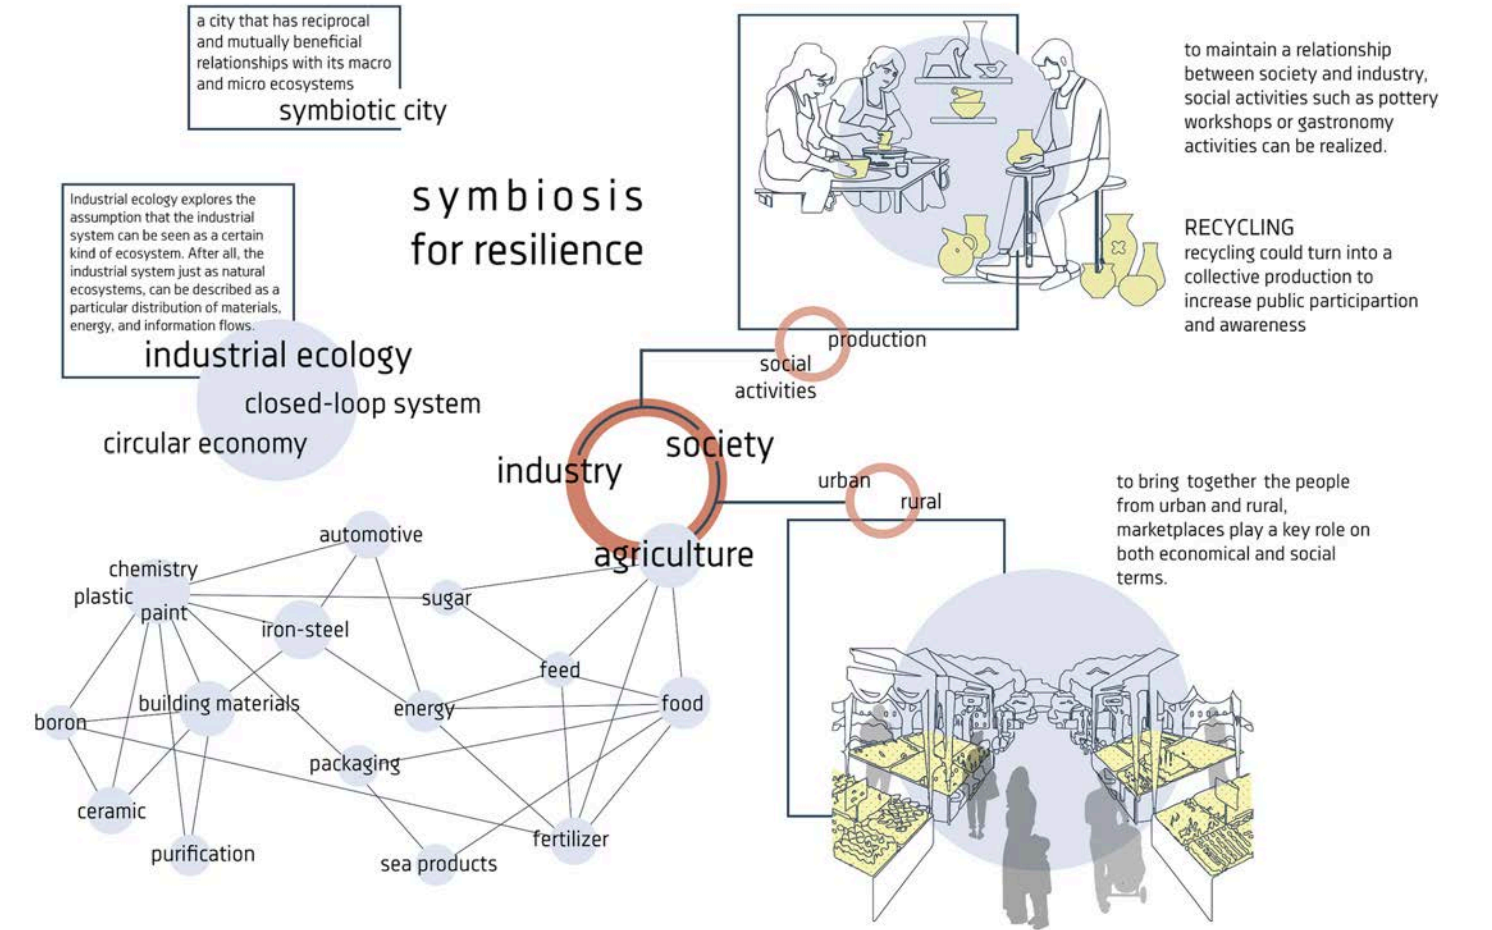

Bandırma'ya 40 milyon metrekare OSB kuruluyor

Balıkesir'in Bandırma ilçesinde, Türkiye'nin sanayisini omuzlayan Marmara Bölgesi, yeni bir OSB'ye daha ev sahipliği yapacak.

Bandırma'da sanayi için bin fabrikalık yer ayrıldı

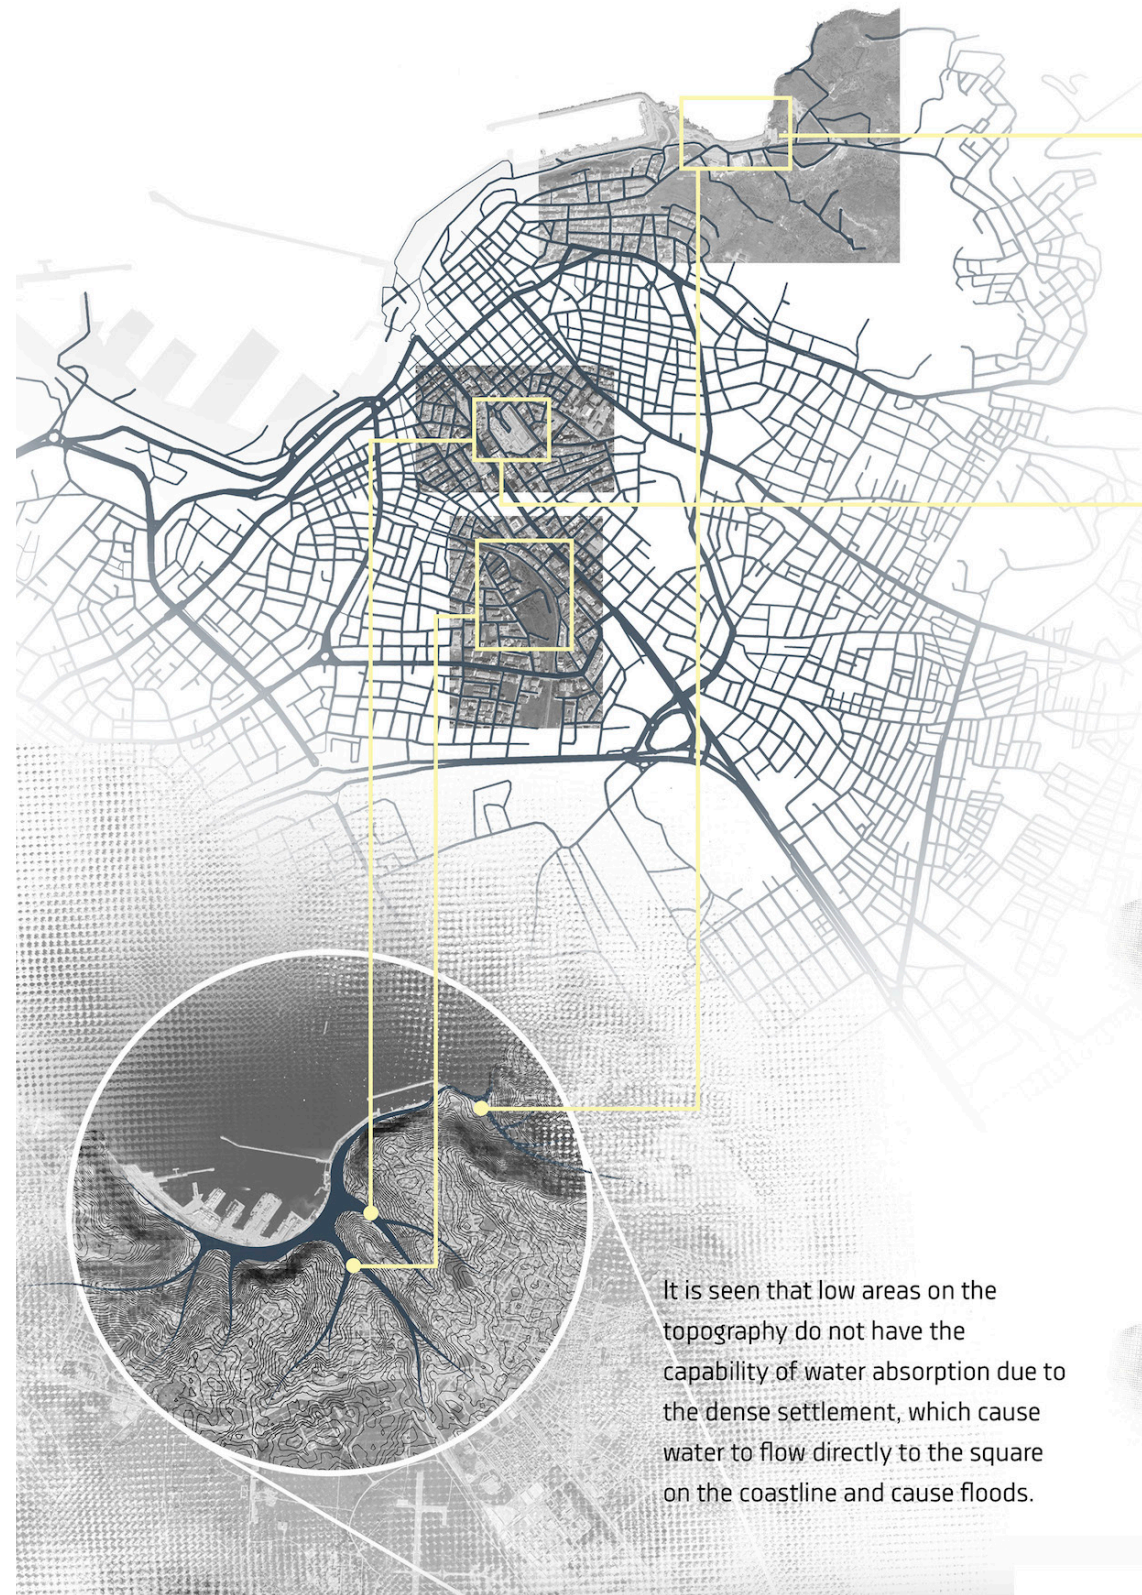

Balıkesir - Çanakkale İmar Planı'nda sanayi için 48 bin dönüm yer ayrıldı. Kimyacılar bölgede 30 bin dönüme özel ihtisas bölgesi kuracak. Toplamda ayrılan alan dolduğunda Türkiye'nin en büyük endüstri bölgelerinden biri ortaya çıkacak

resilience in bandırma

In line with the sub-strategies derived from these main ideas, analyses for the city were conducted to identify regions where problems are concentrated. The most prominent of these is Cin Çukuru, located in the city center. This area, which has been used as a football stadium for many years, holds significant social value in the city's memory. However, as the stadium's capacity became inadequate, it was relocated to the city's periphery. Consequently, Cin Çukuru, after being left idle for many years, has now become a car park. The area's inclined topography and

lack of permeable surfaces result in mud accumulation after heavy precipitation, making its usage problematic. Adjacent to this area are two significant buildings. One is the old power station, which has been converted into a cultural center after restoration. The other is an old hospital building that has been transferred to the university to be converted into a city museum. These two structures establish the area as a culture-oriented public center.

that earn their living from
agricultural activities.

strategies

cohesion

goal 1:
creating a social bound between society and industry

strategy 1:
social activities that makes industry a part of society's
identity
_handcraft workshops (i.e. ceramic)
_recycling workshops - regularly

goal 2:
eliminating the existing negative effects of industry

strategy 2:
while designing urban space for the social activities
above, using desing strategies that eliminate problems
generated after the industrial development
_water management with bioswale areas
_diverse social activity opportunities such as sport
fields and playgrounds

goal 3:
maintaining urban-rural connection

strategy 3:
creating opportuniy for farmers to sell their products
directly to the people in the center without extra costs
_classification of farmers in Bandırma's villages
according to their product type and amount
_marketplaces in city centers for farmers

flow

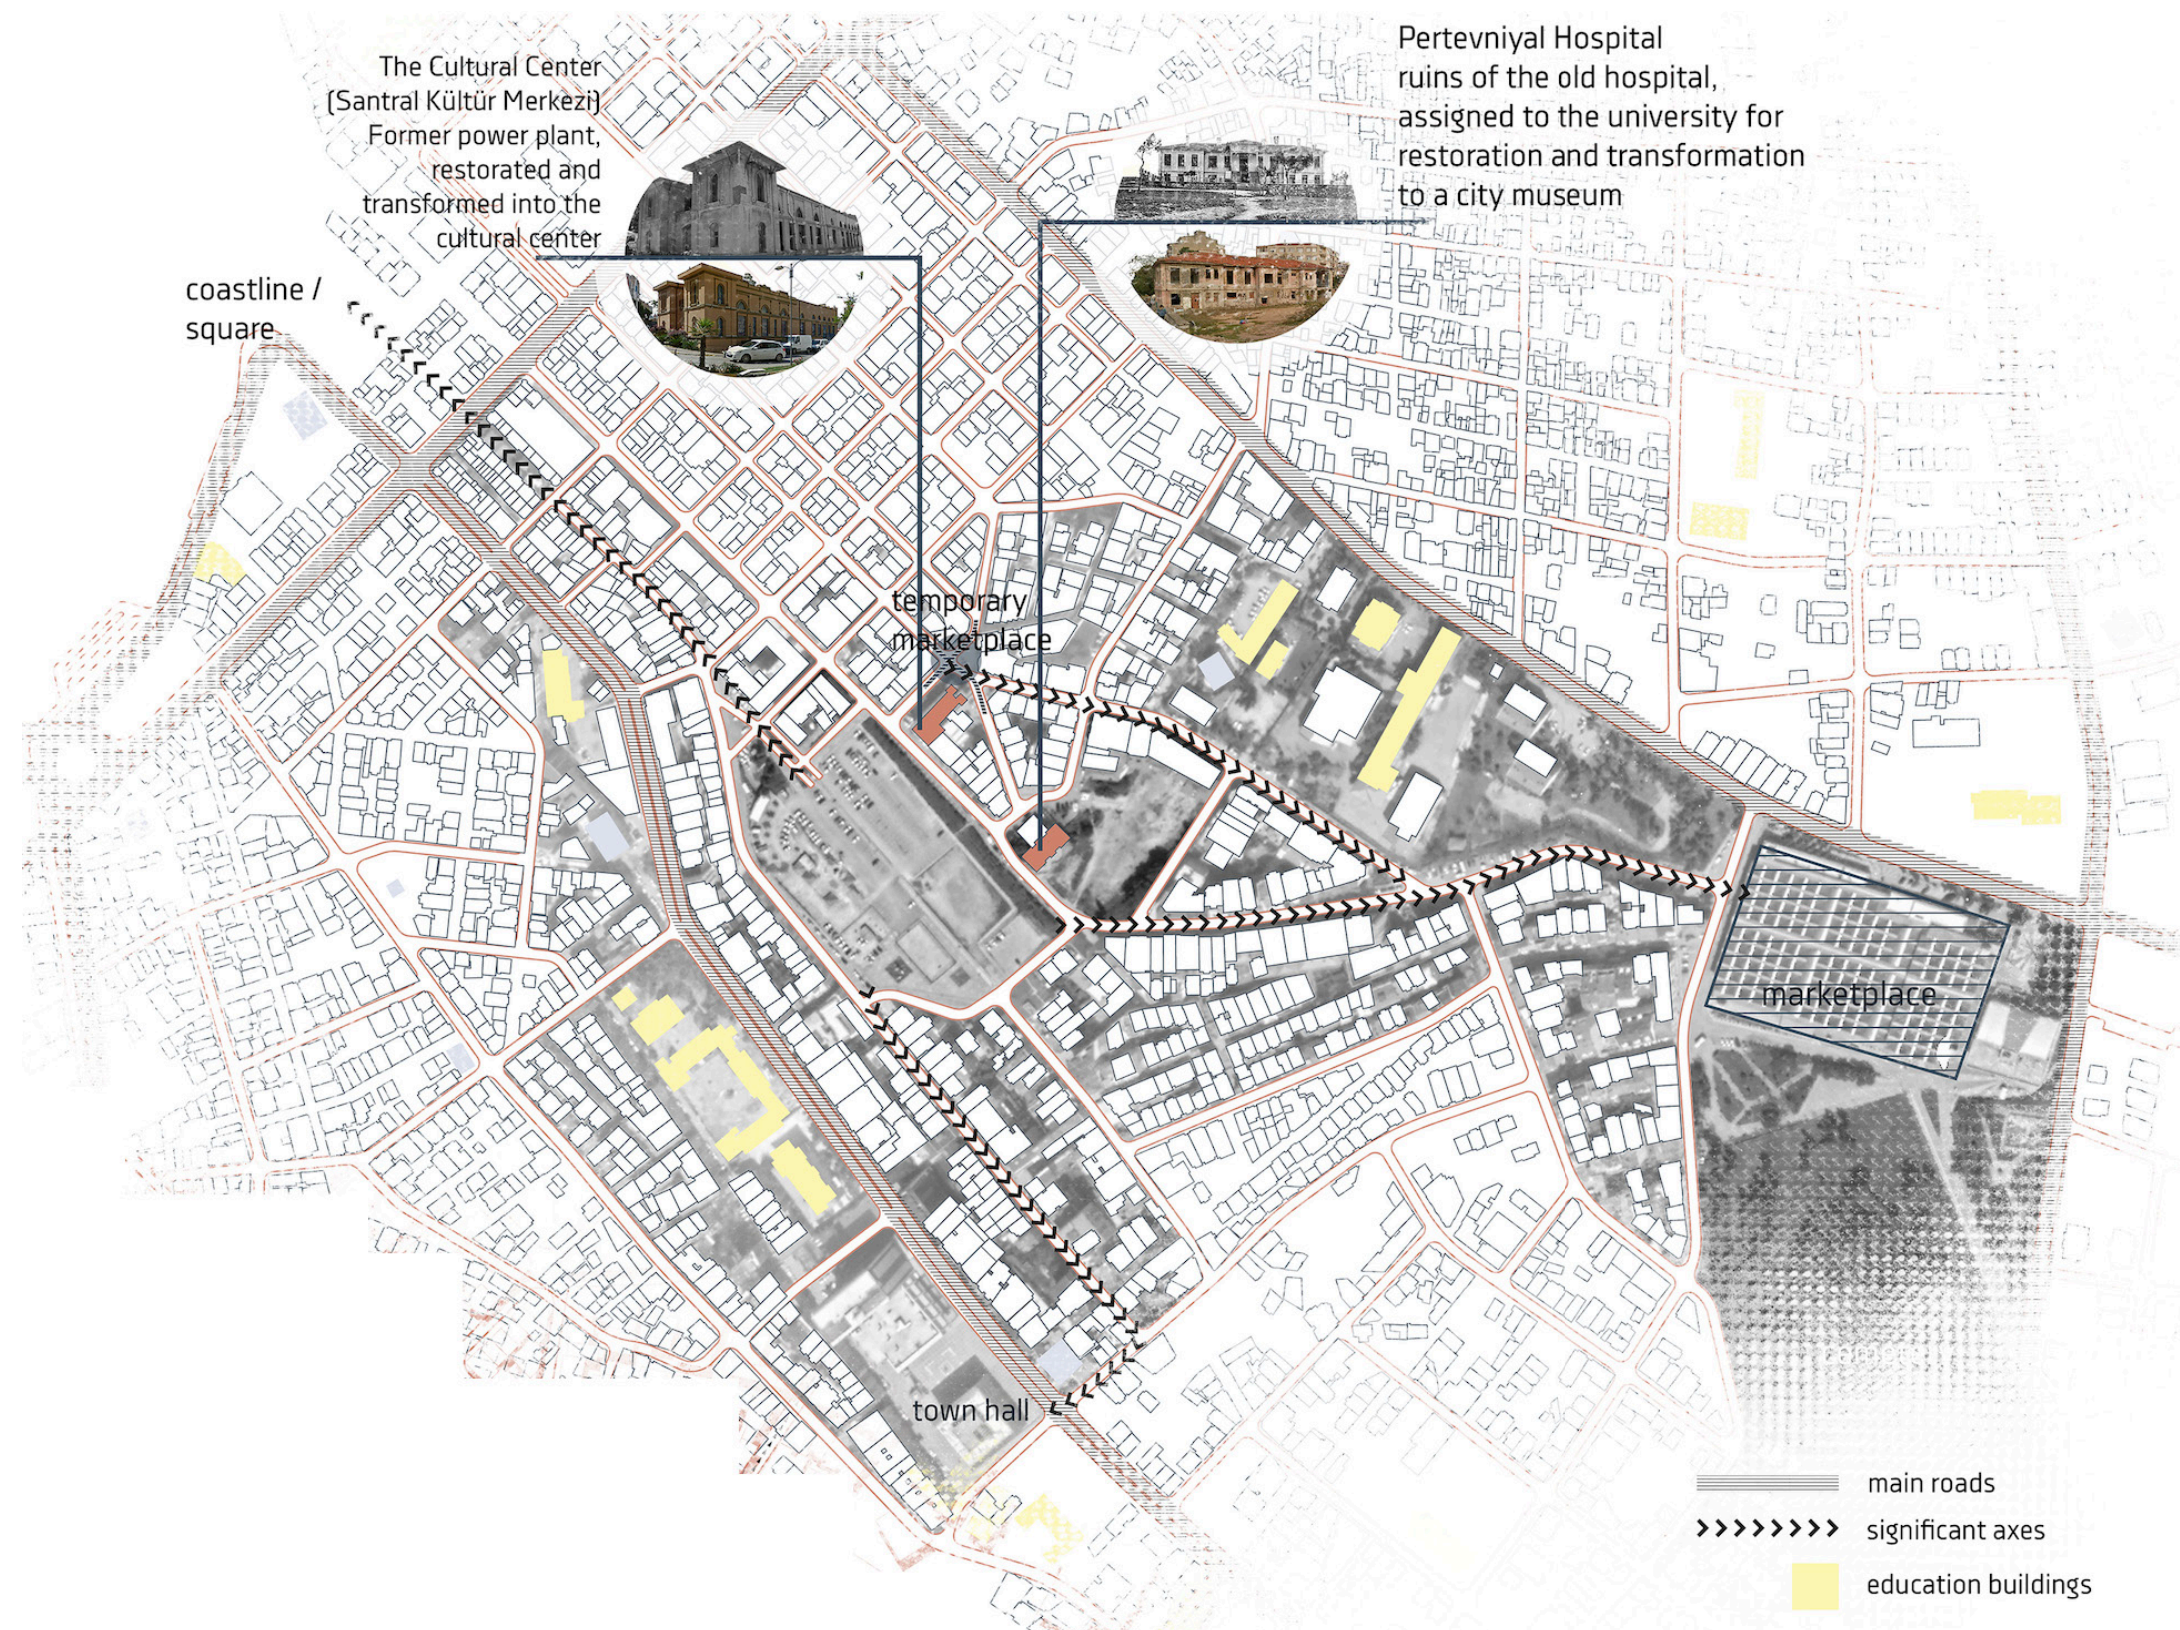

goal:
providing material and energy flow in economy

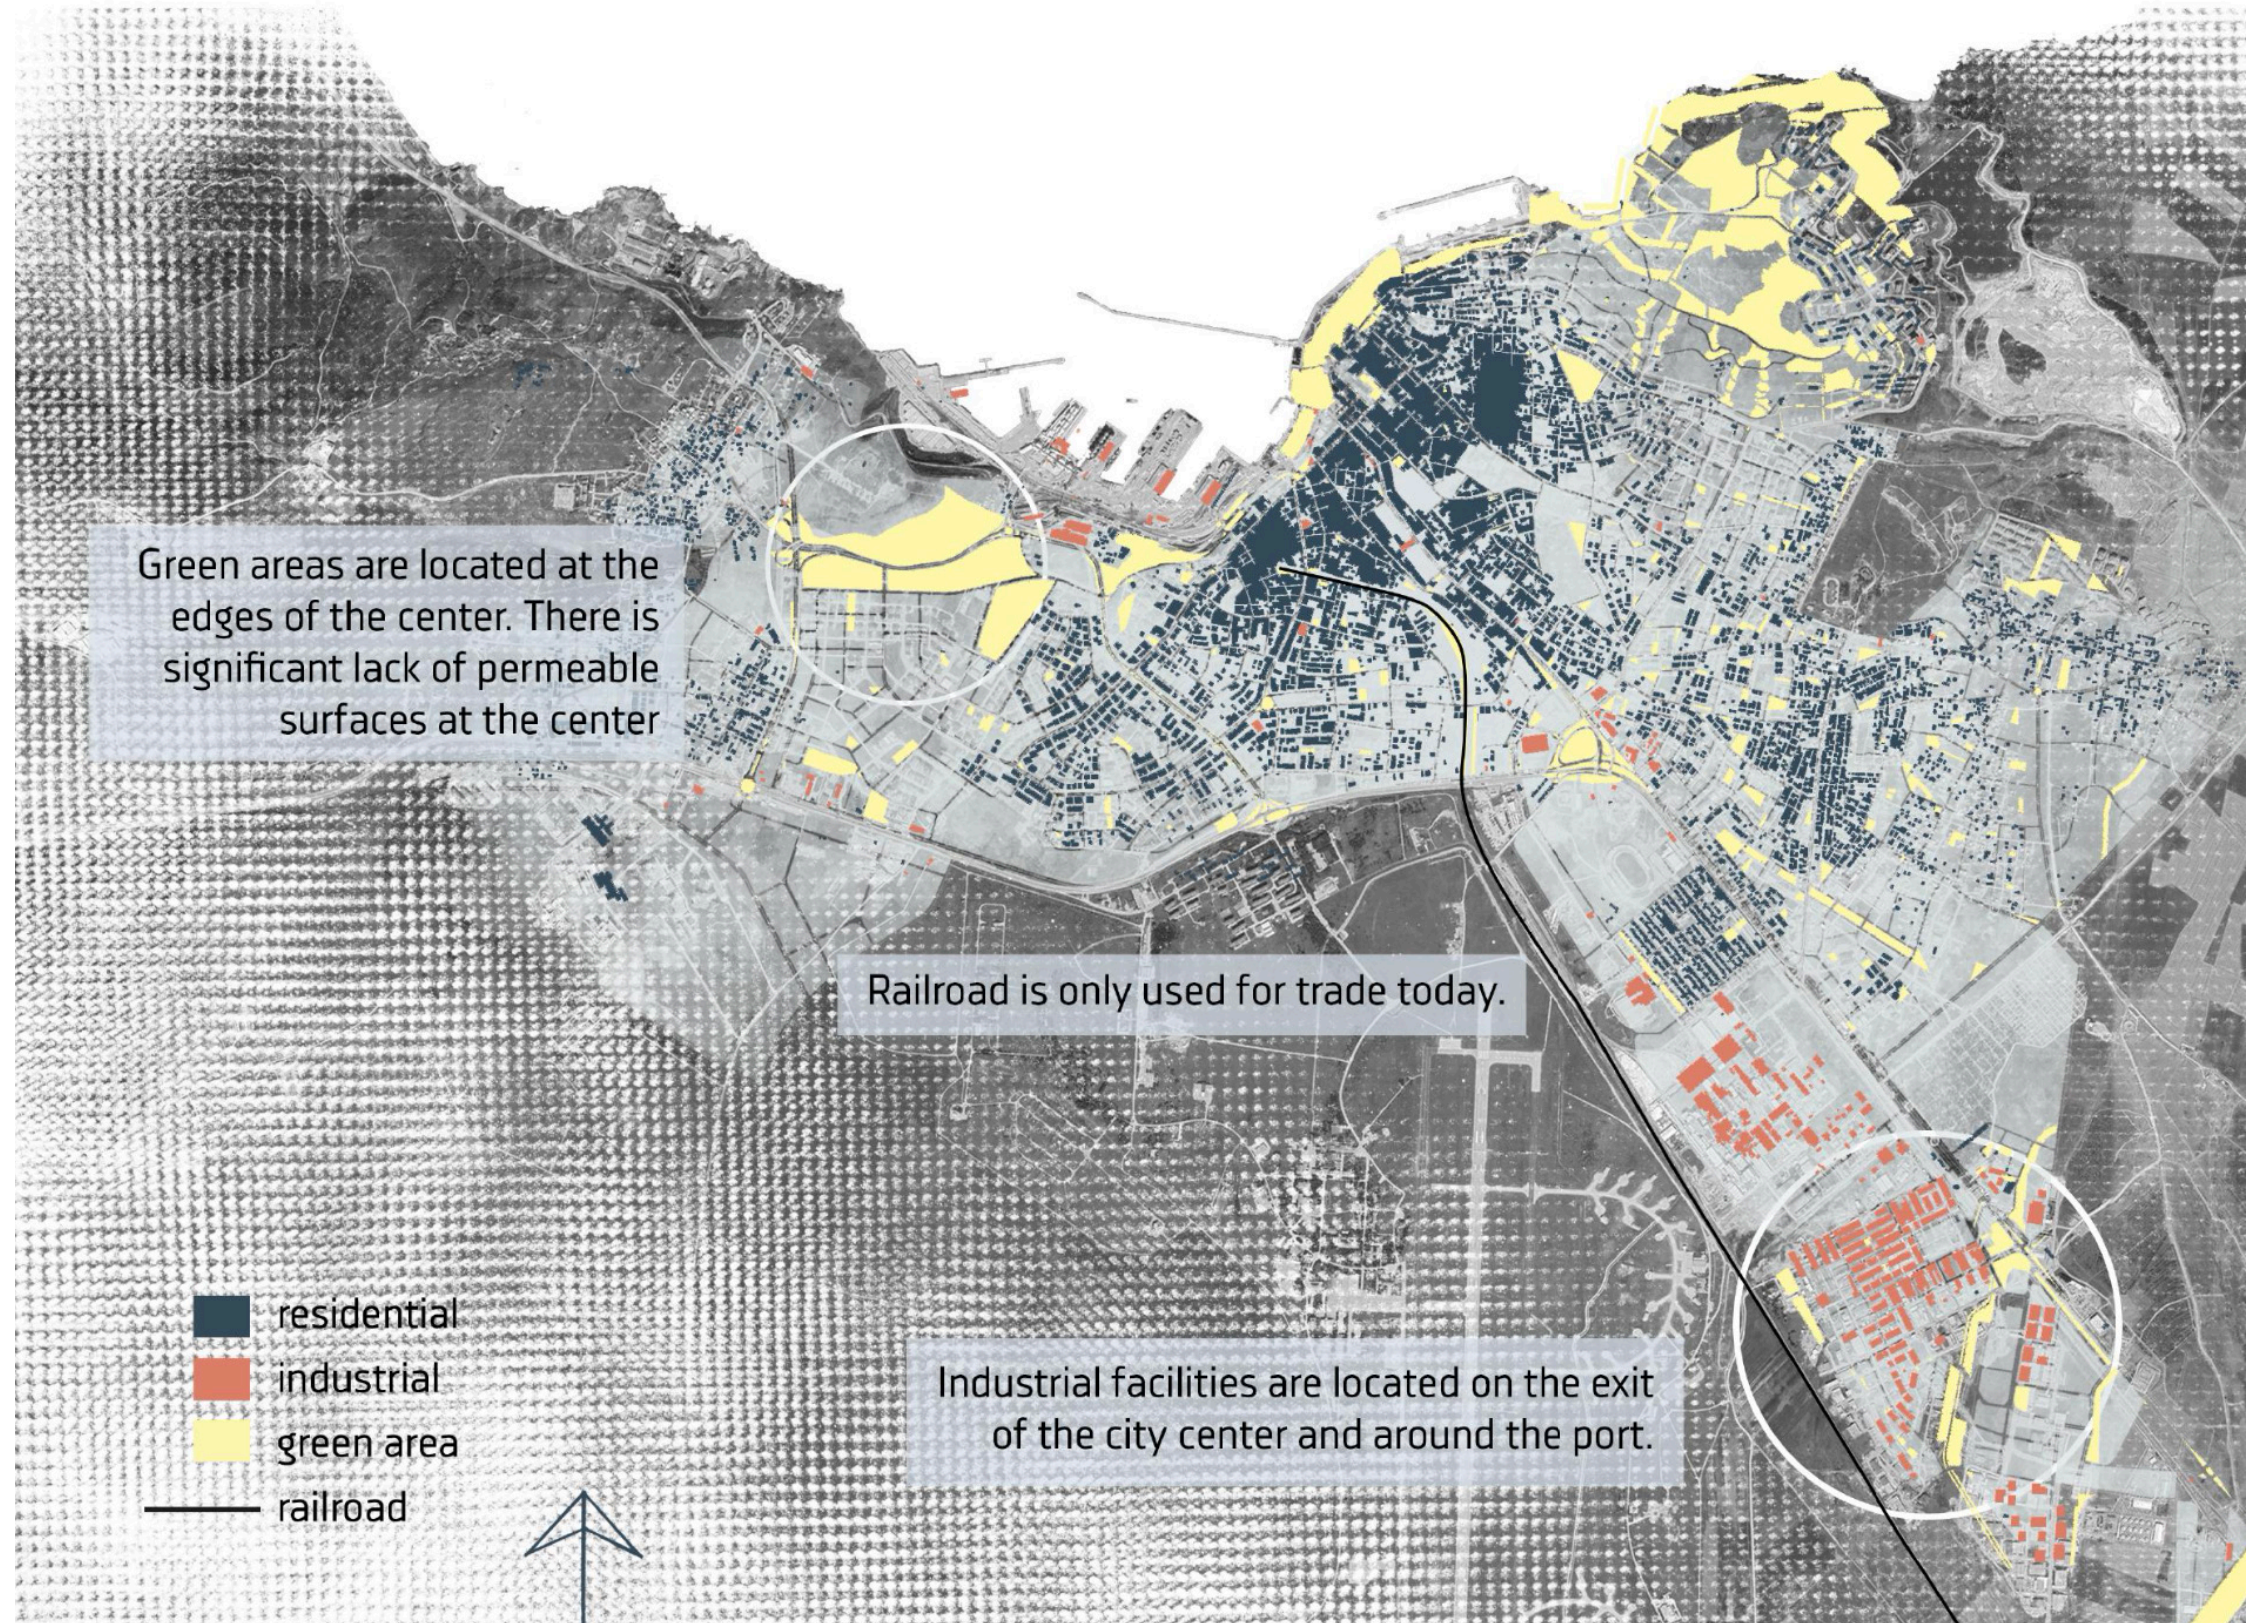

strategy 1:
application of policies towards material transfer between
industrial and agricultural activities as well as general
consumptions in the city
_specification of reusable material
_collection and classification of waste

strategy 2:
integration of urban waste to this circular system
_urban furniture made from recycled material
_using urban gray water in irrigation

In this context, the design decisions considered for the area are as follows:
 Parking Needs: Due to the significant need for parking in the area, this function has been largely preserved, with a portion of the parking moved underground.

Rain Gardens: Rain gardens were created in the direction from which the water flows. This section has fewer human activities compared to the rest of the area, allowing for better water management and natural filtration.

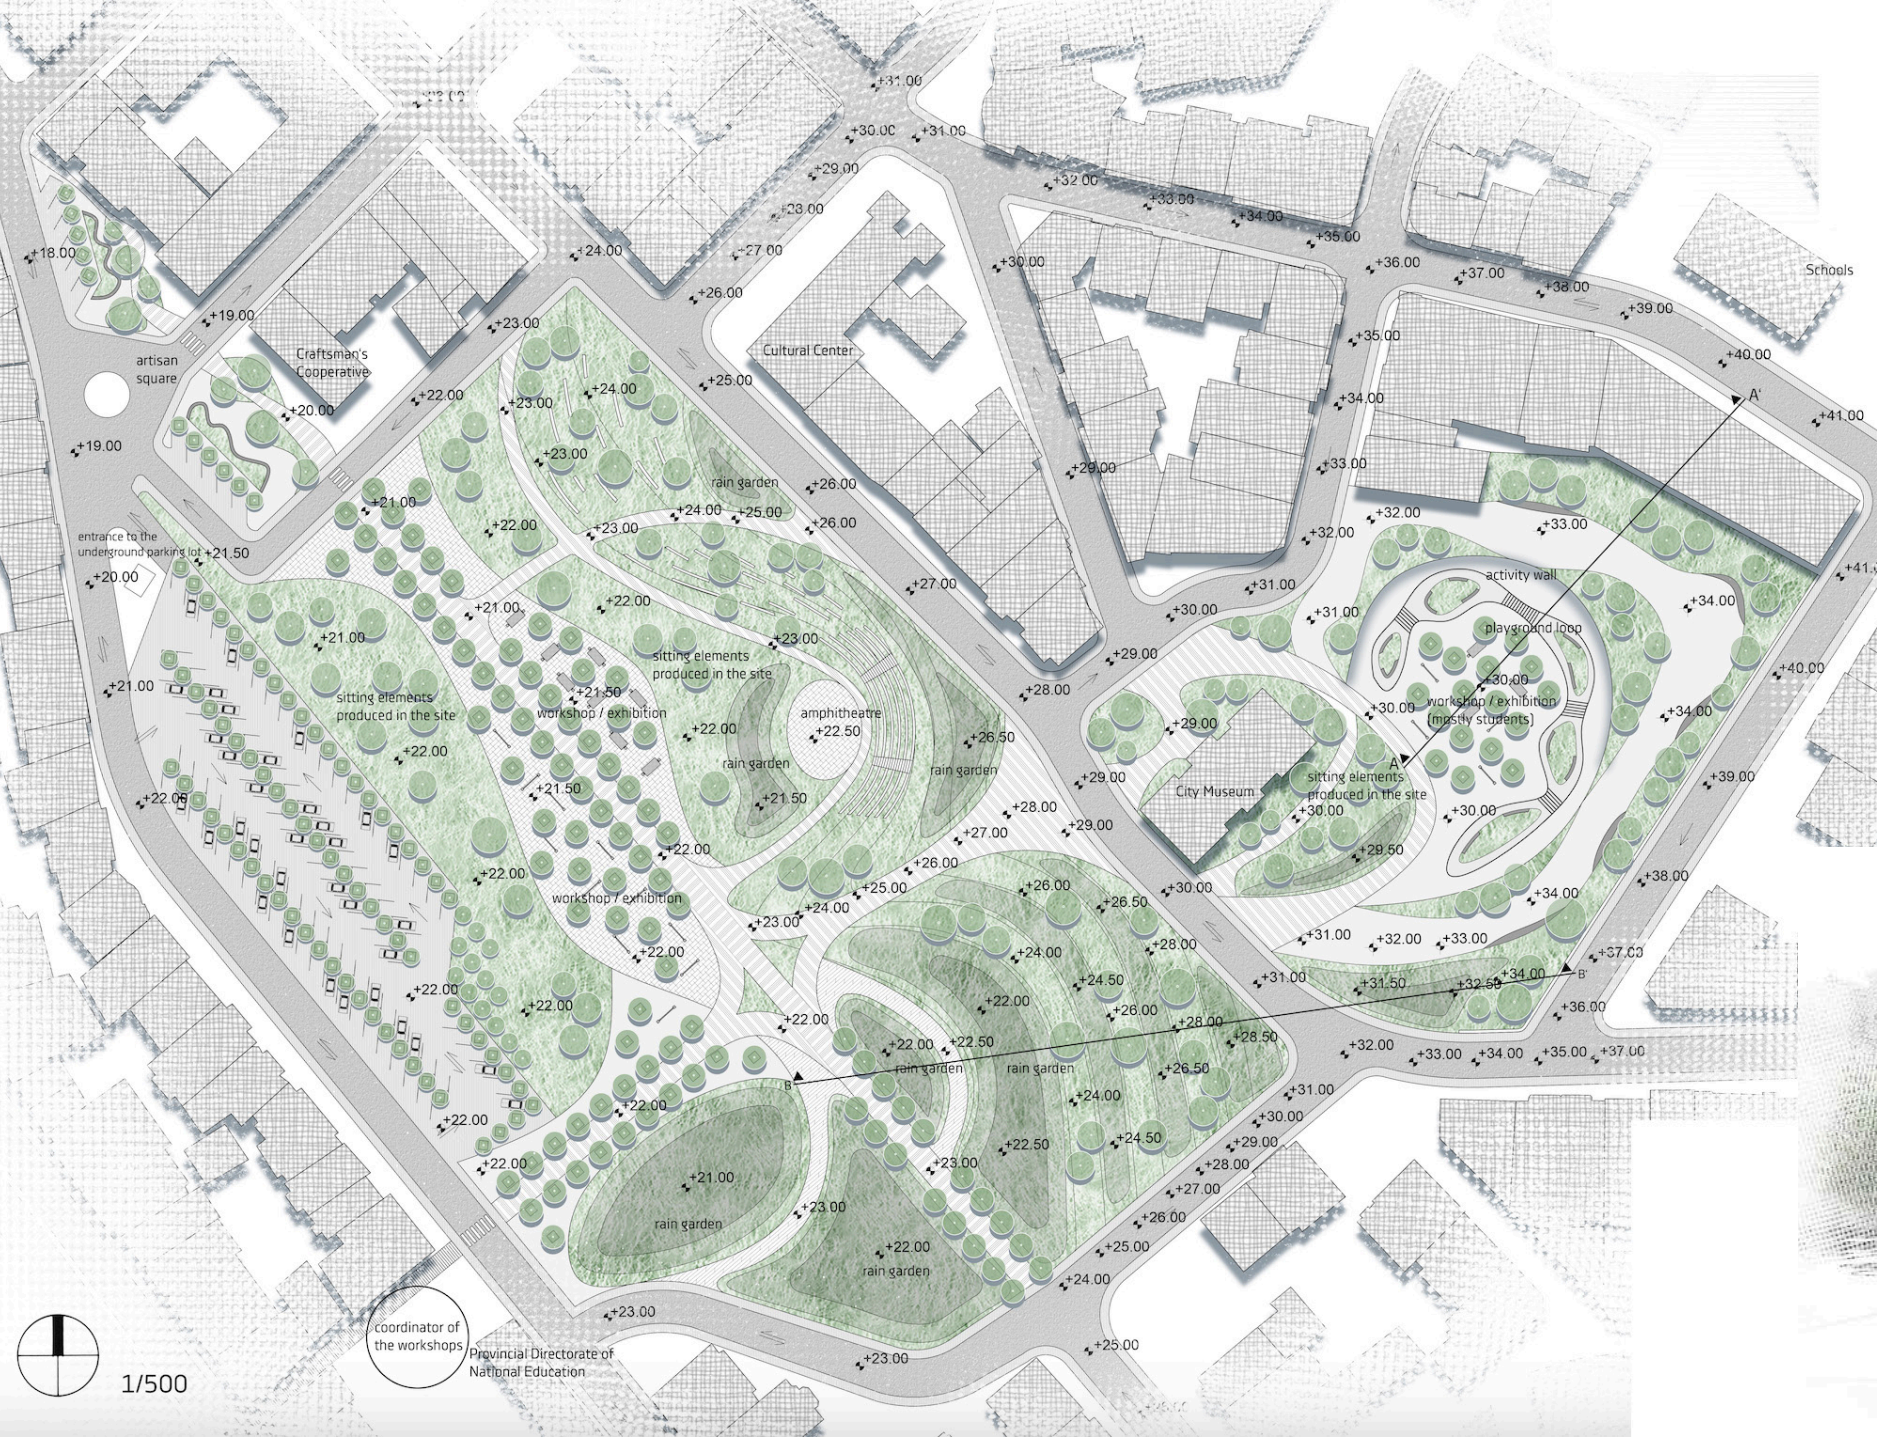

Topography and Access: To address the access issues posed by the topography, a ramp was constructed to divide the area into two, creating a new topography. One side of this ramp features rain gardens, while the other side includes an amphitheater. The amphitheater serves both the cultural center's activities and events held by Bandırmaspor fans, who continue to celebrate in this area.

Workshop/Exhibition Structures: Structures for workshops and exhibitions were established to support the industry-society relationship. These structures allow for the collection of plastic, glass, paper, and other waste materials. Regular workshops, coordinated by the District Directorate of National Education, transform these structures into workplaces and later into exhibition spaces. They are strategically positioned along the main axis to attract passersby.

Urban Furniture: Urban furniture on the green surfaces will be created by the community, fostering a sense of ownership and creativity.

Educational and Play Areas: The area adjacent to the city museum is primarily intended for children and students, given its educational function. It includes an educational and continuous playground, along with a wall where children and youth can express their creativity. Various installations using waste materials and street art, such as graffiti, are encouraged. Additionally, workshop/exhibition structures in this area are designated for use by children and students from nearby schools.

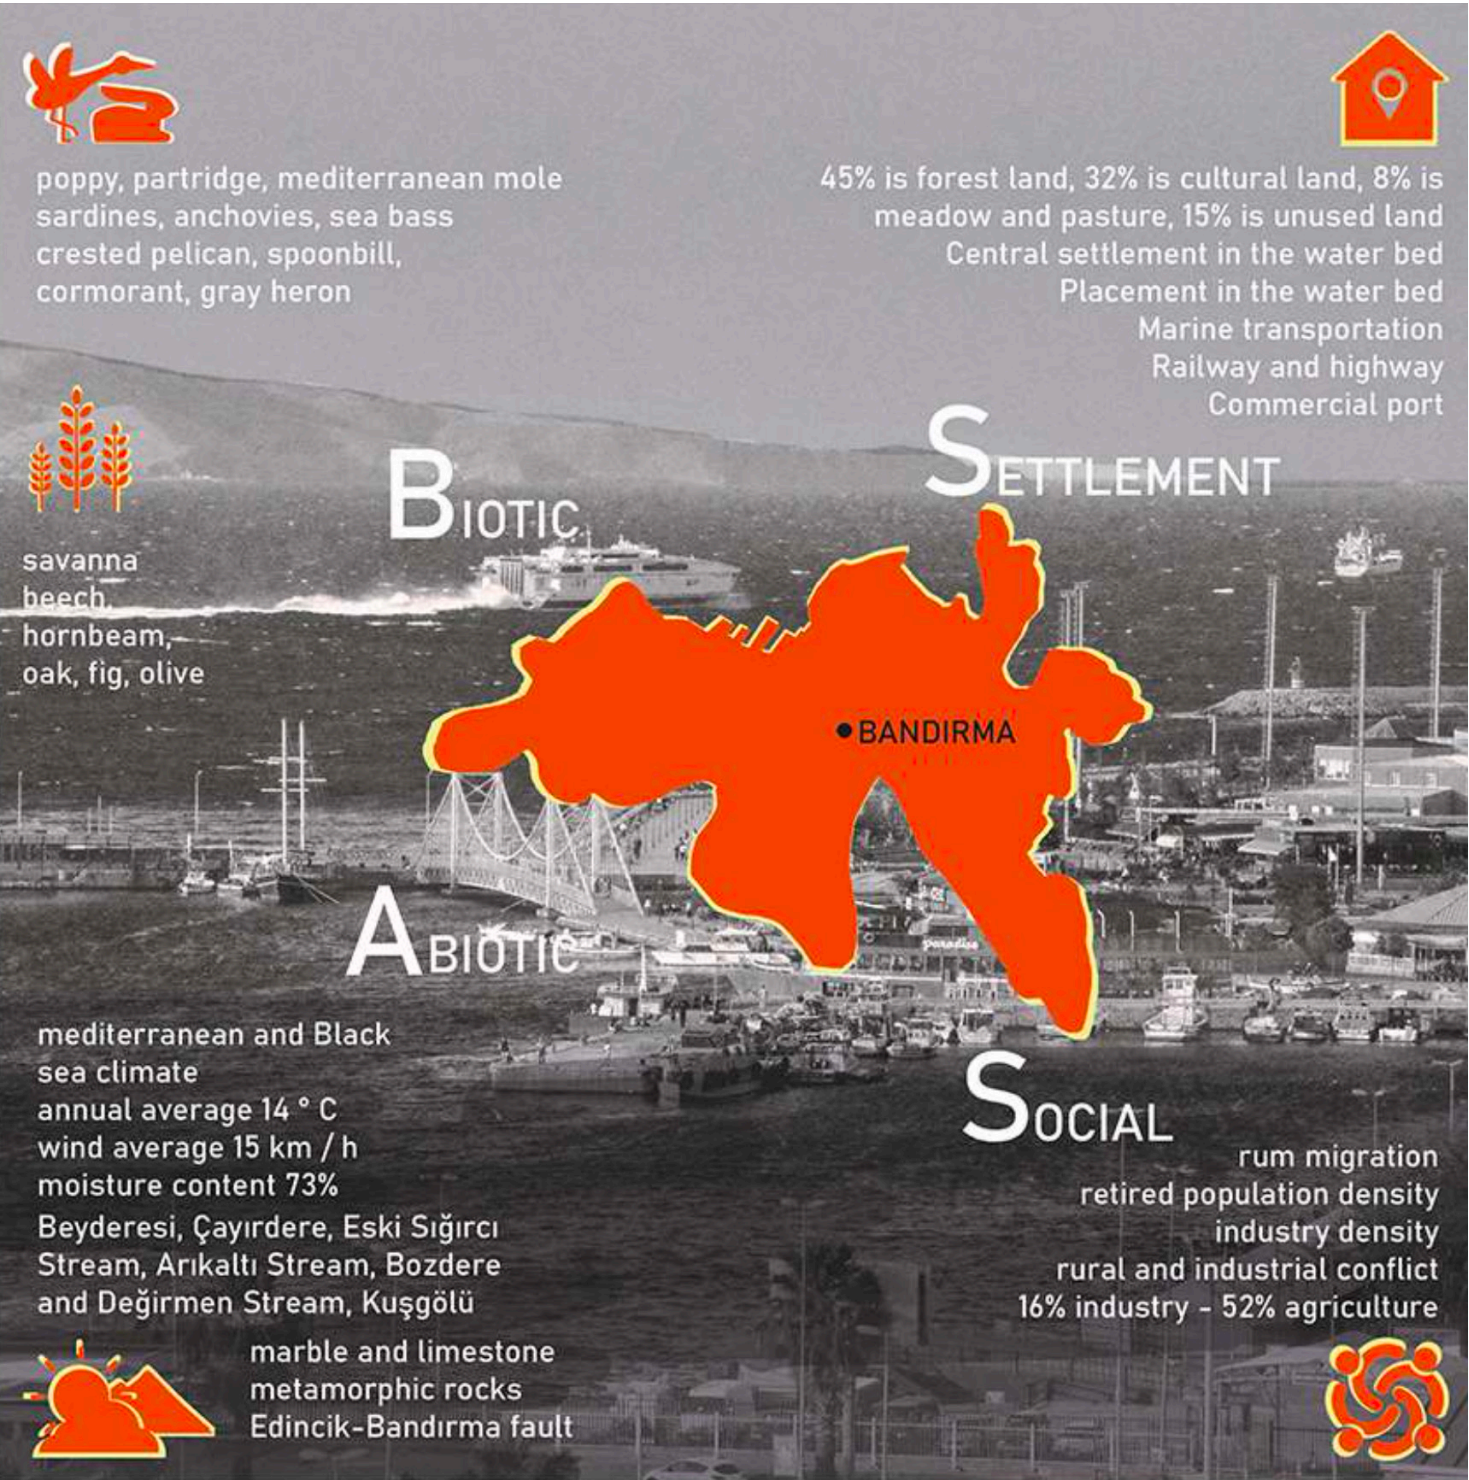

parking // this function has been significantly preserved
rain gardens // fewer human activities compared to the rest of the area
amphitheater // both for the activities of the cultural center and the events of Bandirmaspor fans, who are still making celebrations in this area
workshop & exhibition structures // for the productions to be carried out in the context of the industry-society relationship
urban furniture // to be created with the productions of people
educational function // educational and continuous playground, activity wall

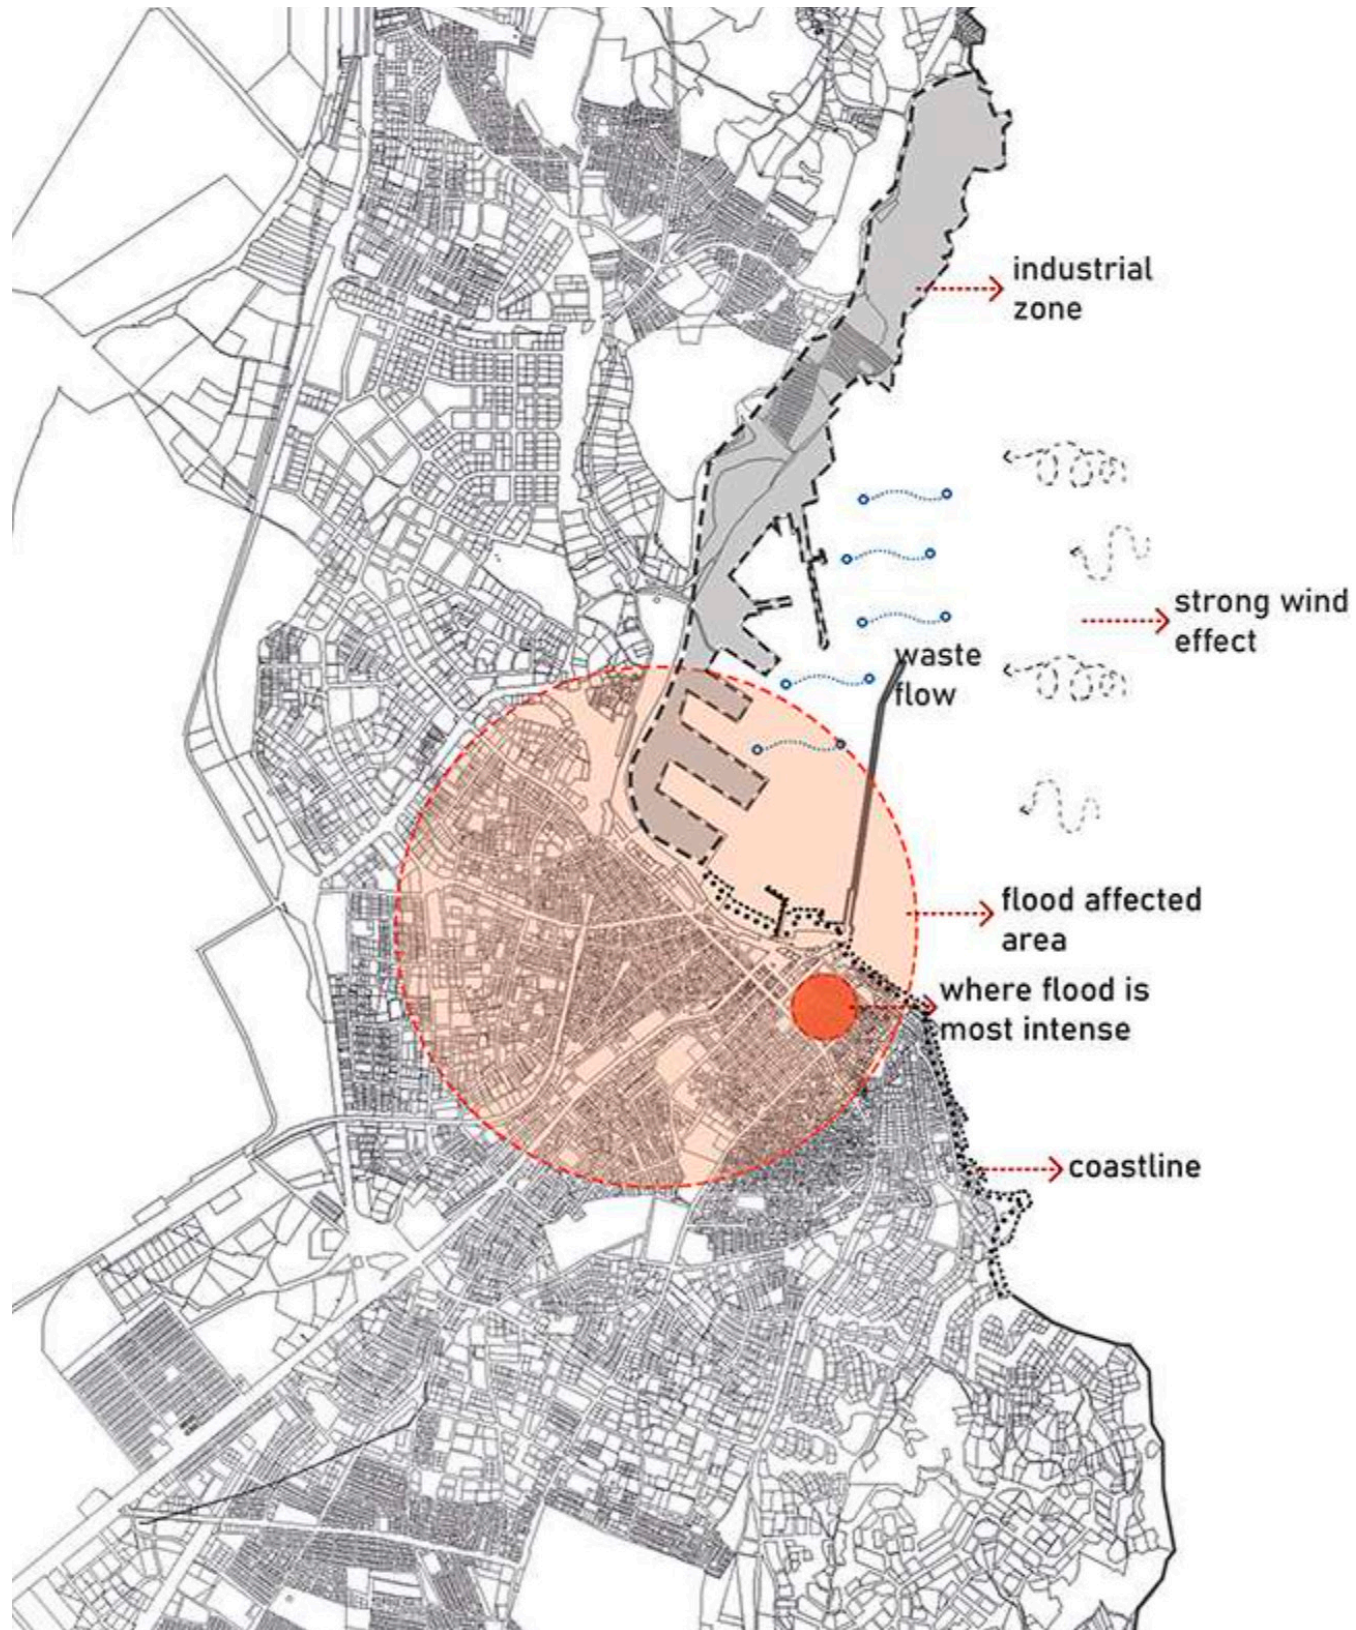

Revitalizing

Ecem Cengiz

“Revitalizing” was produced within the scope of Landscape Design 3 carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Çisem Demirel under the title “Multilayered Negotiations: An Urban Manifesto For Resiliency of Bandırma” in the spring semester of 2019-2020.

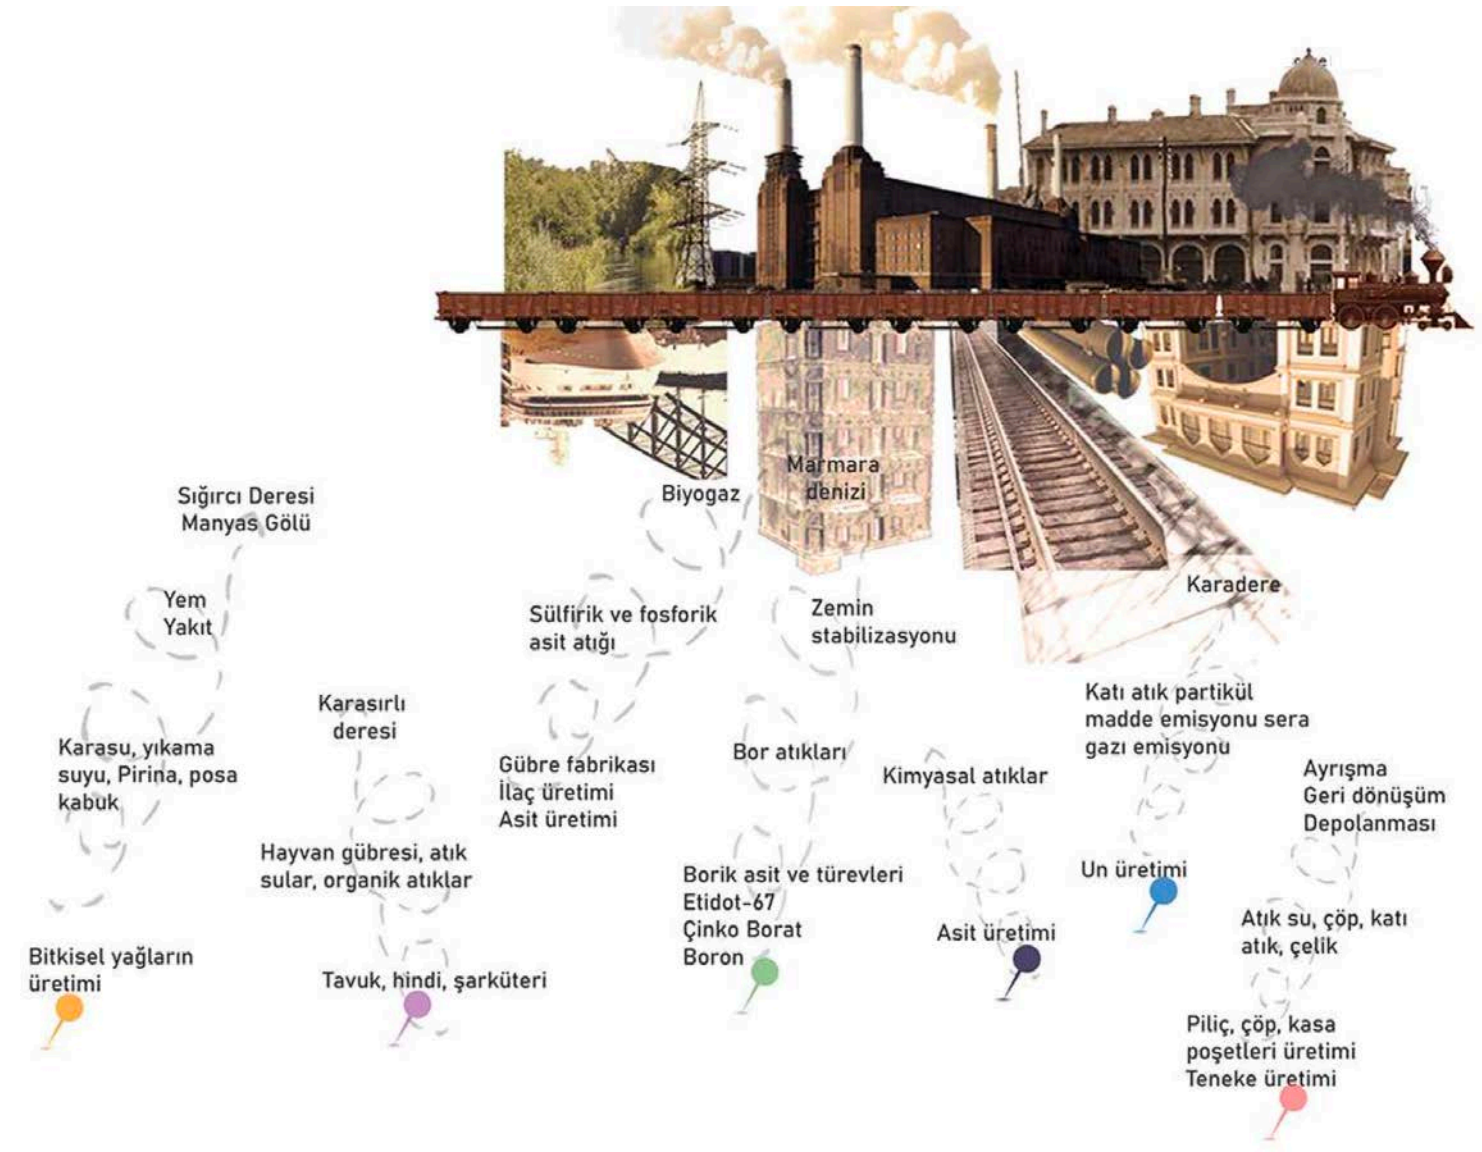

I named this process “revitalizing.” When addressing durability in Bandırma, I began with this keyword. Just as resilience cannot be realized with a single factor, revitalization cannot be achieved through one element alone. Bandırma’s industrial intensity is an undeniable fact with serious effects. Since I cannot eliminate it, I must integrate it. The biggest problems I identified are waste management, flood risk, and the lack of integration between the seaside and the city.

Bandırma’s infrastructure is old and inadequate, and the high percentage of impermeable surfaces causes blockages and flooding from waste. Sewage waste is discharged directly into the

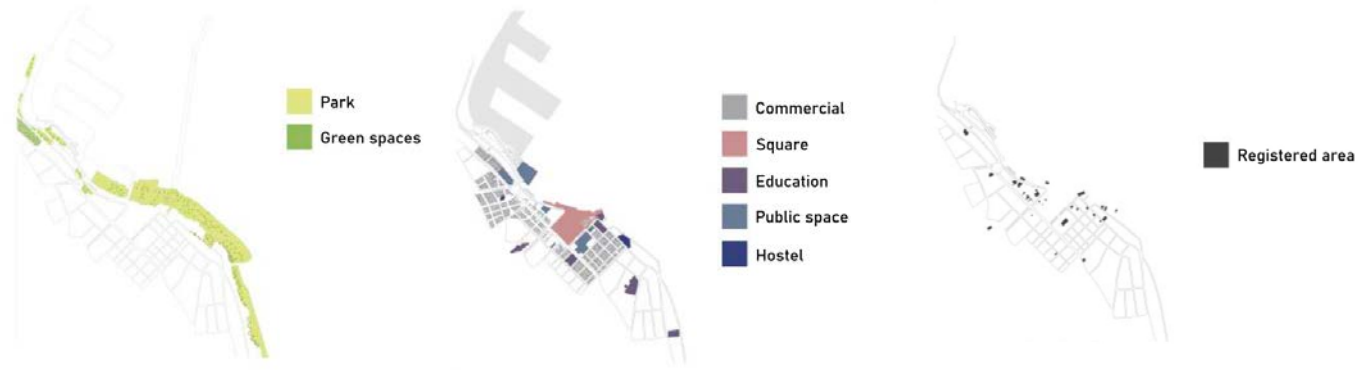

bay, causing marine pollution. This situation discourages people from using the waterfront and harms marine life. Therefore, my goals are to remove waste, redesign the flood risk areas, and bring the natural beauty of the seaside back to the people.

Choosing a focal point is crucial for initiating this process. The intersection of water, waste, and flood risk serves as an ideal starting point. For this reason, I selected an area that will integrate the coastline into the city. I applied designs and techniques aimed at not only mitigating these issues but also providing a pleasant and healing environment for people to enjoy.

TECHNIQUES:

Design inspiration:

In this project, the concept of urban resilience is examined under three key topics: floods, waste, and connectivity. Bandırma frequently experiences floods, resulting in both financial and environmental damage. To address these issues, a comprehensive project has been developed.

A space was designed to strengthen the connection with the seashore, allowing people to spend more time there. A salt marsh was created to help remove waste and prevent flooding. Rain gardens and increased green areas were implemented to ensure effective water collection.

Large green spaces were designated for people to spend time comfortably. Plant species such as *Salix babylonica*, *Liquidambar orientalis*, and *Laurus nobilis* were used in the area. These plants were chosen for their shading, visual screening, and wind-breaking properties, as well as their flood prevention and water and air cleaning capabilities.

Detention ponds have become one of the most effective solutions for stormwater management. They excel at slowing runoff, containing sediment, collecting trash, and removing pollutants. Moreover, they are often cost-effective and provide a touch of nature in an otherwise concrete-dominated environment.

The Manifest

İrem Güvenç

THE
MA
NI
FEST

ism(noun):

A manifesto is a published declaration of the intentions, motives, or views of the issuer, be it an individual, group, political party or government OR ?

Every attitude on earth needs a space to exist. Locations create context. Places call focus. Editing a space creates the manifesto and makes it live. Now we all have to admit that here is a huge waste of time trying to save each other's lives and create discourses. Let them do one needs a hero. We are poor together, together with our places and people. However, we have heard so much about success so far that we could not dream of failure. The clash of imagination, which experiences the causality of meaning nonsense with a brain that can know that space and age exist in different worlds, arising from subsequent belief in all adjectives, is the pre-acceptance of failure. Adjectives are an imposed way of classification. Whether you want it or not in a single real place, you have to host a lot of time, so failure is inevitable, my friend. Give up radically separating the person and time from the space, both will mutually produce each other. Good, bad, beautiful, ugly, enough, different, timeless and guilty. If it is impossible to get rid of adjectives, or if only God can do this, you have to let all adjectives sit in a corner of the space you created. Whether or not you have to include all contexts in your ideology, make an endless empathy, feel the fire of nothingness and being and act without reason. Remember, you do not have to do anything. It never happened but in this case I can easily classify you. Your identity is so without you that you cannot even object. I wonder, could all these isms come out of Gogol's Cool? Does the community, where you base your ideas and ideologies on a common memory, does not aim for a totalitarian acceptance for us? If I disagree with you, shouldn't I go to the place you created? Which track of hiding behind ism also covers me, men? Of course, you do not have such an obligation, but why did you surround every manifesto you created in a universal language? Nihilism, fascism, socialism, capitalism, minimalism, cubism, dadaism, impressionism, expressionism, dualism, academism, modernism, futurism ... What class are you hiding behind? What are all these systems intended for? Dude, these are just paintings you can draw on your own canvas. If you want to build a space, you must include me. Even if I'm never going there. They are mimics in the chaos of languages. Anyone can understand. You know, the sense of humor is blunted by someone who decides to commit suicide. If you say something wrong, his funeral will stop next week. The nature of the action is deep and works instantaneously. Some of the actions constitute the crimes and these crimes do not separate from the place with the isms you live in your dreams. Man, places are the context of crimes. If you need air to make your voice heard, you should have venues to announce their actions. Which system can refuse this by refusing common memory? Dude, if you don't like what I say, you can cry in your diary. I hand over the CV at the future. If you make one city, you destroy another. You can transfer the manifesto through places. Establishing a relationship with silence reveals the inability of the burned. Sometimes things you talk about from space can also be true. While nobody hears his voice from the void, the value of silence deepens but this does not change the reality of what you are talking about. This will surely fail you. Dude, here you have reached the end of the story. You are now free to enjoy your absolute failure. Dude, I can be a little person in a little room. I can be one of the poor people waiting for the night's sleep to come and the day will pass and offer me environments that can change the flow of even a person like me. Dude, I don't expect much. Please do not. All dramatic fictions begin when something goes wrong in the life of the character. You know, what I want from you will surely make you a failure.

Urban Manifesto: Urban Justice

Gizem Yağmur Gölbaşı

URBAN MANIFESTO:
URBAN JUSTICE

Edip Cansever "People are like where they live," he says. Cities are the mirror of their society as well as the place where people live. It changes and develops like people. This arduous journey is filled with countless stresses and shocks. It is an absolute imperative for a city to be durable to cope with these threats and dangers.

The connection between the city and the human gives birth to the rights and freedoms that are closely linked. Cities and people are also liable for debts as much as their rights. We have responsibilities towards the cities that we borrowed from the past and will inherit from the future. Preparing the city for stresses and shocks and making it more livable are among these responsibilities. A resilient city is a bridge between the past and the future. Preserving the past is the right of the future.

It is the fair system in which it is built that keeps a city alive. Living in a fair city strengthens the sense of belonging.

City, justice and joint ownership...

Air, water, soil ... are the blessings that nature bestow on living things unconditionally. And the rent arising on it is common property. All the potential and problems of the city constitute an equal responsibility for the residents of the city.

Urban rent should be distributed fairly. It is everyone's right to live in a good environment. The fact that a certain number of people are affected by the risks of air, water and soil is in contrast to the principles of environmental justice.

The generosity of nature and the abundance of Bandırma lands have been fighting the consequences of being an industrial city for years. Every innovation that Bandırma adds to its structure directly affected the Bandırma population. Bandırma, which has an increasing population and has an industry and logistics identity, is more exposed to mass threats such as epidemics, air pollution, traffic and irregular settlement compared to other cities. Extending the life of the city and delivering it to the next generations with the least damage requires more effort in this case.

Bandırma lands continued its abundance from past to present and offered many opportunities to the city. However, even though the geopolitical position it has placed on the urban identity brings it closer to the solutions, the world is inevitable change. All balances that have occurred up to now with climate change can be disrupted, and the situation that will be most affected by this is the circulation between polluted air and wind.

Bandırma should not expect wind from air pollution and should create an infrastructure that will provide fresh air to the city by considering the possibility of climate change. The high increase of respiratory diseases has strongly revealed the relationship between the city and health. Sea meadows are an opportunity for Bandırma as a Mediterranean formation that grows in Southern Marmara. Bandırma has an important role in eliminating air and sea pollution, restoring biological diversity and preventing floods. In this way, even if the climate changes and Bandırma cannot benefit from the north and northeast winds, it will have lungs by hectares in its seas. It is a key stone for ecology and will especially bring the fauna back to Bandırma waters. In this way, employment areas such as fisheries will disappear and a new breath will be brought to solutions for unemployment problems. It will protect the shore from bad surprises like flood, by controlling the waves.

These approaches will increase the comfort of the inhabitants in the city and at the same time ensure the health of the society. The foundations of a sustainable, natural resources respectful and self-sufficient system will be laid. This flexibility gained by the city will present it to future generations.

As a result,

The city is everyone's right.

Idea Overview

ACCESSIBILITY-INTERSECTION-TRANSPORTATION PLAN OF THE AREA

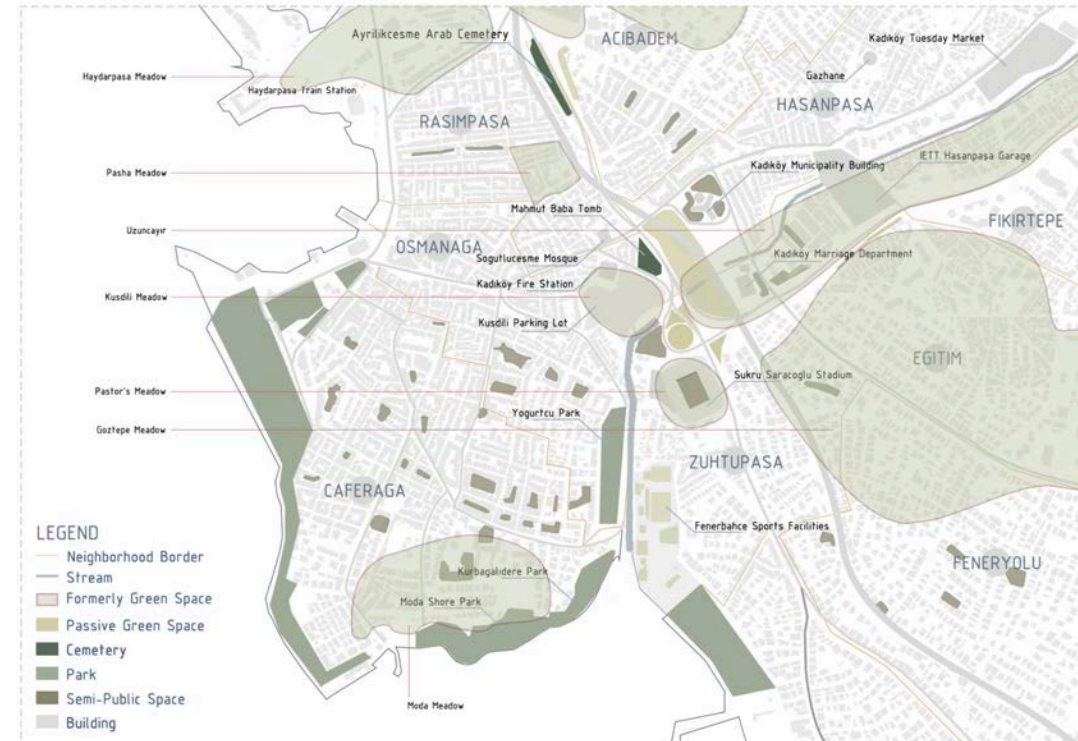

2020-2021 Spring

GREEN AREA DISTRIBUTION AT CITY SCALE

GREEN SPACE DISTRIBUTION-FORMERLY GREEN SPACES OF THE AREA

LD III / Un-Tangling the Node of Kadıköy: Infra(structural) Land(scapes)

EVALUATION OF THE AREA WITH THE USER'S THOUGHTS

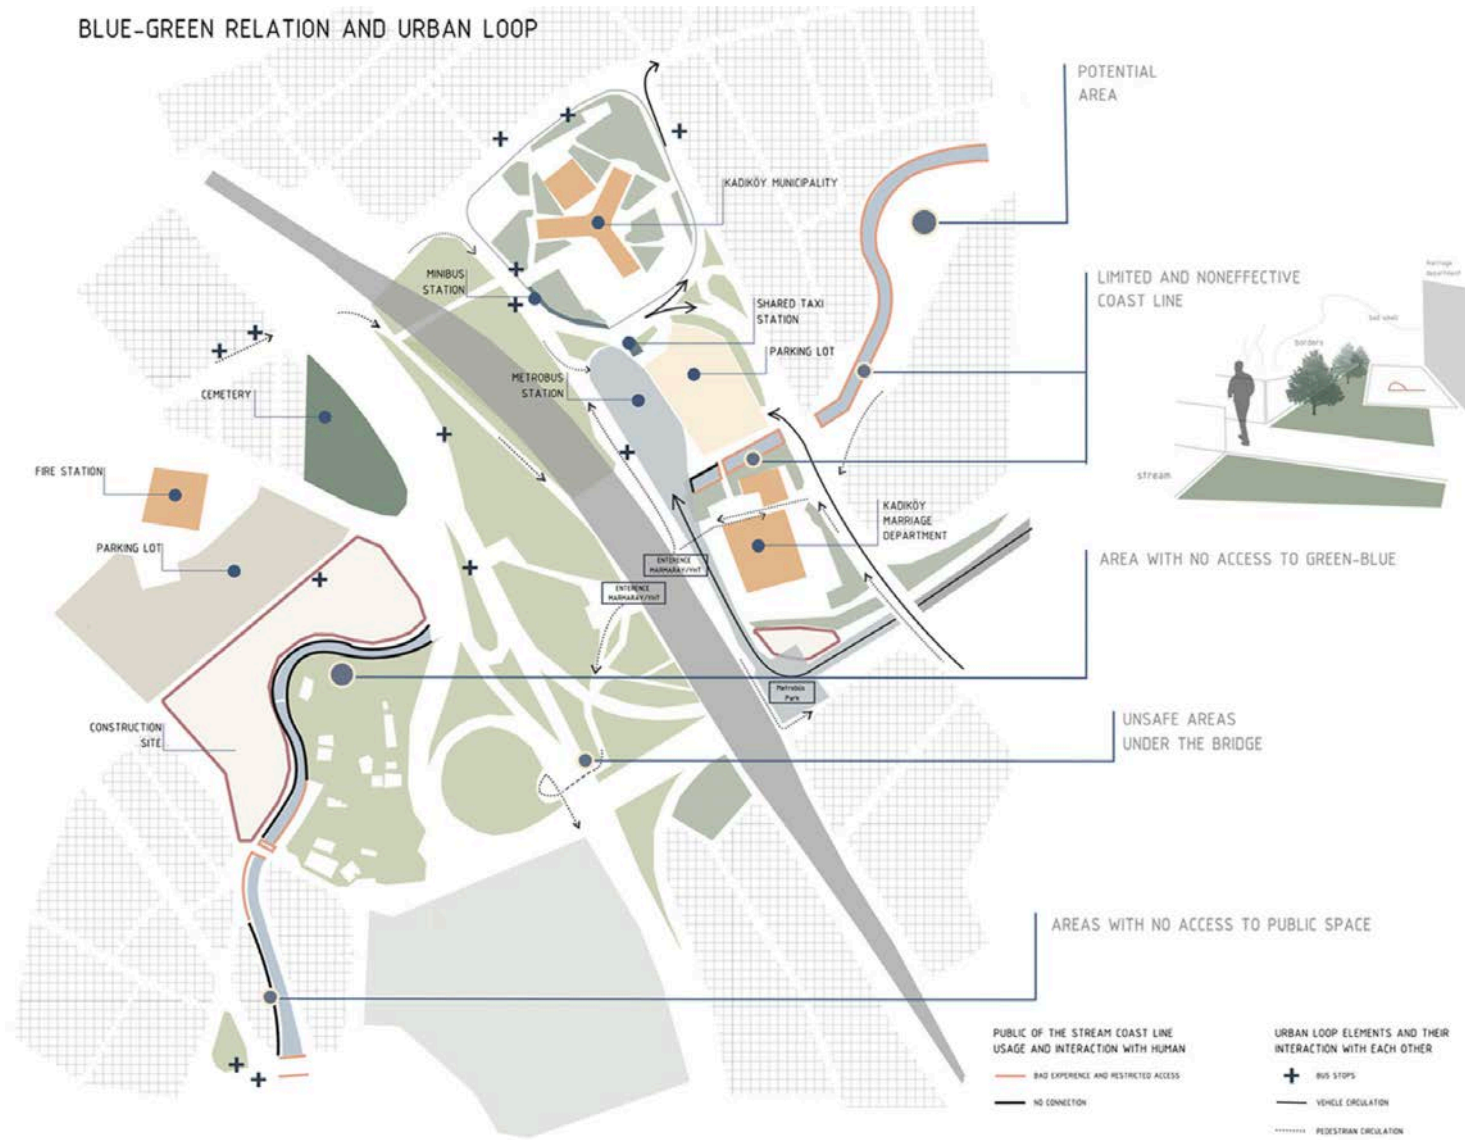

To understand the area, we examined the historical changes of Kurbagalidere through a historical analysis. While the transportation network shows that many different transportation routes intersect around the area, this feature enhances accessibility at a macro scale but causes issues at a micro scale.

The green-blue system analysis revealed that Kurbagalidere, an urban river space, holds significant ecological importance for Istanbul. Kurbagalidere's status as a natural and cultural heritage site, coupled with its recreational potential, underscores its importance for urban sustainability. Coastal habitats in cities act as biological chains and life corridors, with water serving as a vital connecting element.

From a philosophical perspective, the concepts of "listening to water" and "learning from it" were highlighted. Over time, water has lost its binding role due to changing relationships with it. For water to regain this feature and facilitate social interaction, it must develop a mutually nourishing relationship with the city.

In continuing our conceptual approach, which emphasizes learning from water and enhancing urban sustainability through water socialization, we designed spaces integrated with a mobile application. These spaces focus on sustainability and awareness, adhering to principles such as increasing permeable surfaces and creating water-friendly borders.

SYMBIOTIC

SOCIALIZATION

RELATIONS

DISSECTION OF THE ELEMENTS THAT FORM THE CITY IN KADIKÖY IN TERMS OF SYMBIOTIC RELATIONSHIPS

SEMI PUBLIC SPACES --- OPEN SPACES

The green areas of municipal buildings, which are semi-open public spaces, are areas that are not accessible to people in daily use as they are closed areas.

WATER --- GREEN AREAS

The water systems that could not be sufficient for the rapidly increasing urbanization caused some malfunctions and started to cause the present stench of Kurbagalidere. As a result, the reclamation of the stream was decided and the huge concrete, which was the reason for the separation of green and blue, was filled into the stream bed and its shores.

WATER --- UNCONTROLLED URBANIZATION

Water is a natural element that cannot be controlled due to the fact that our country does not have a good infrastructure system. While the natural stream in Kurbagalidere should have been the source of life for Kadıköy, it was stuck in concrete and could not fulfill its duties.

CARWAYS --- PEDESTRIAN ACCESSIBILITY

The damaged open area settlements in Söğütluçeşme affect people mostly in terms of accessibility. It is a problem for the city dwellers, who are on the move every day, to find their way in the areas left over from the vehicle roads.

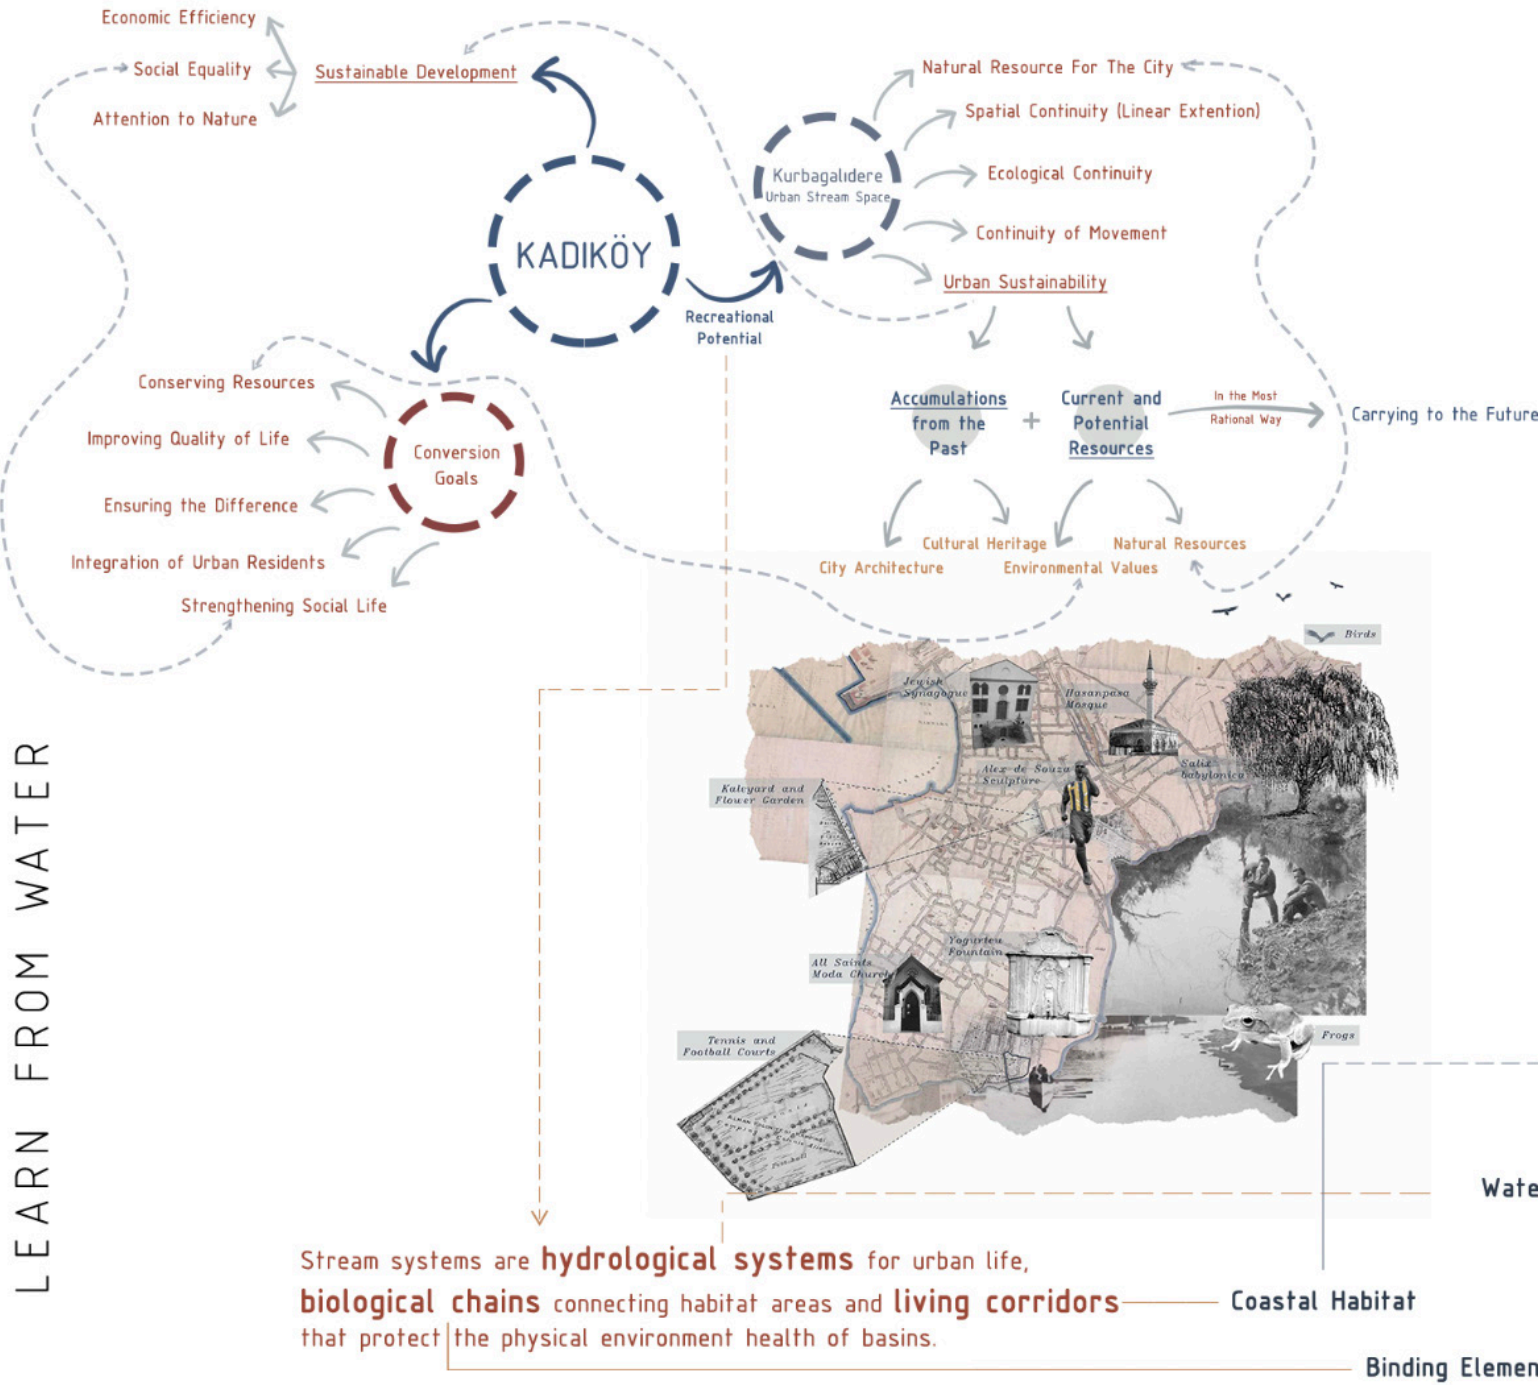

CULTURAL HERITAGE --- UNCONTROLLED URBANIZATION

Söğütluçeşme area is an area where we have difficulties in reading the traces of history concretely and therefore it can be called an area that has become unidentified. Many cultural values have disappeared and become history.

GREEN AREAS --- UNCONTROLLED URBANIZATION

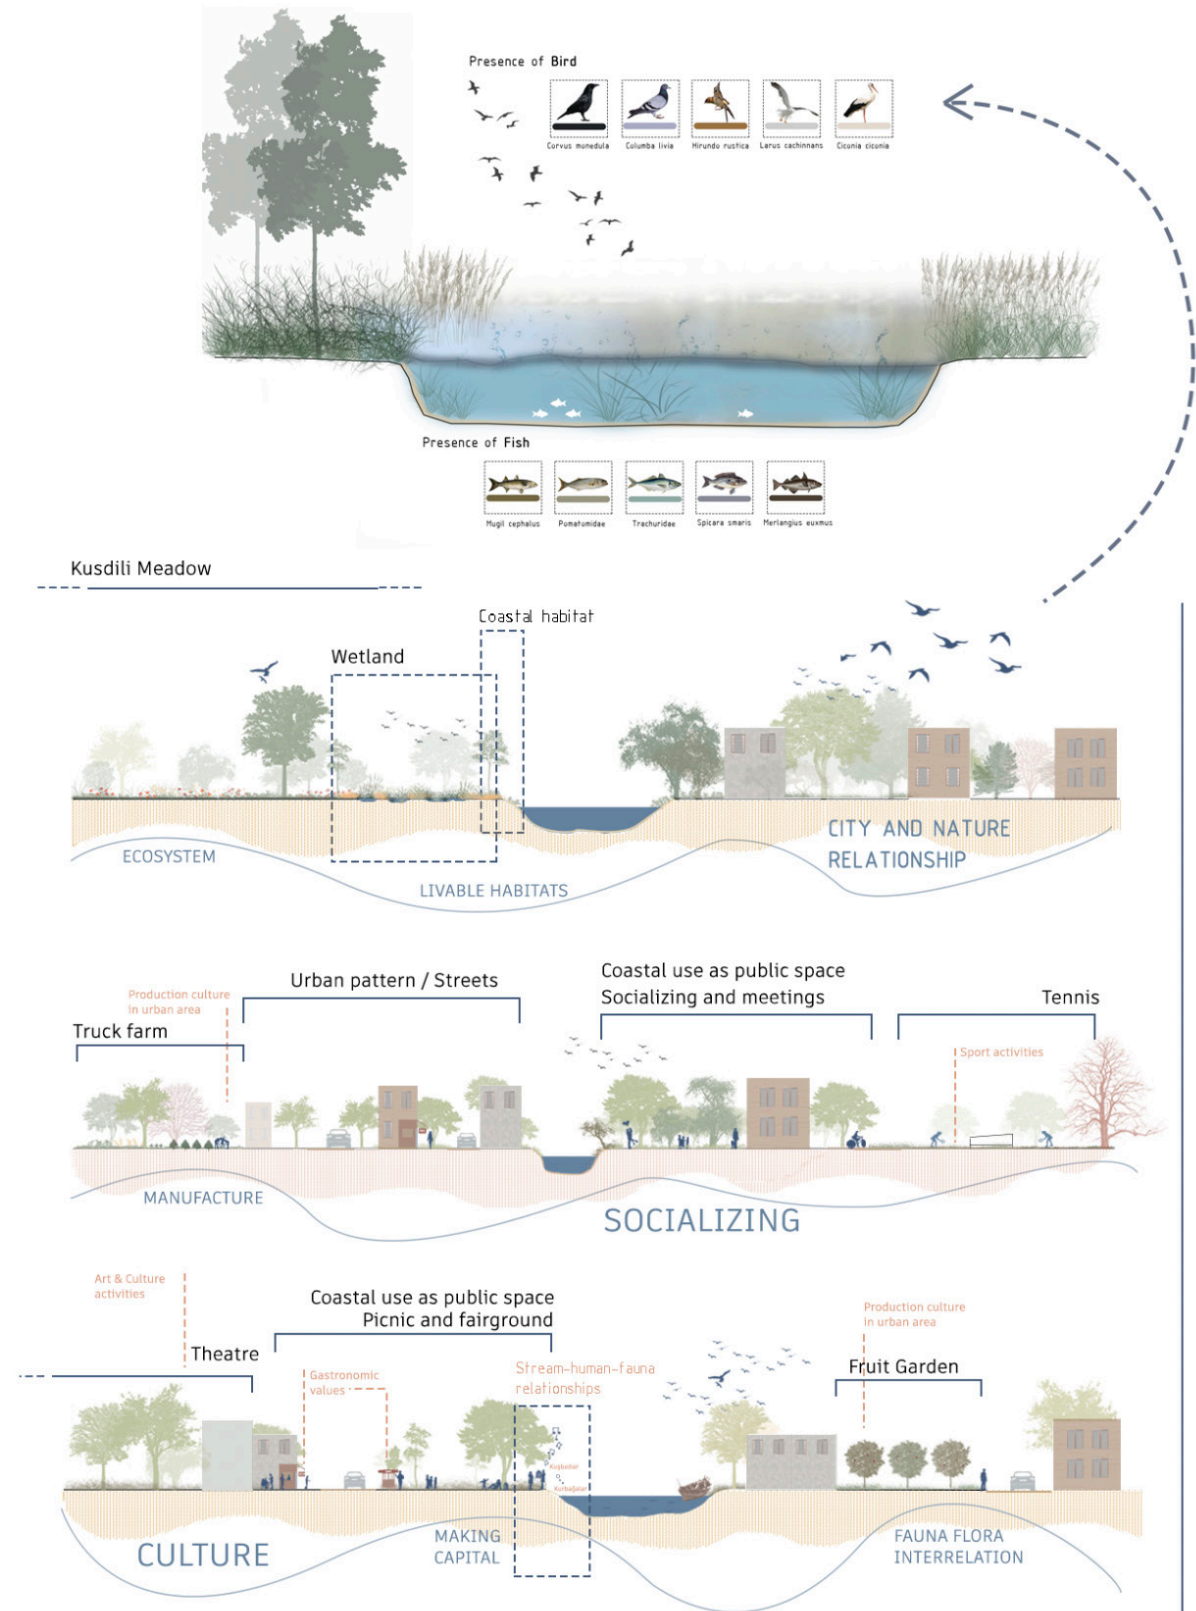

While Söğütluçeşme was home to many meadows, namely a large green ecosystem, according to history read from Pervitich maps, today this green is reduced to very small areas.

Labels on diagrams: Kadıköy Municipality, Marriage Department, Marmaray / YHT Station, From Kusbili Meadow to parking lot, Kurbagalidere, Metrobus parking, From meadow to residential area.

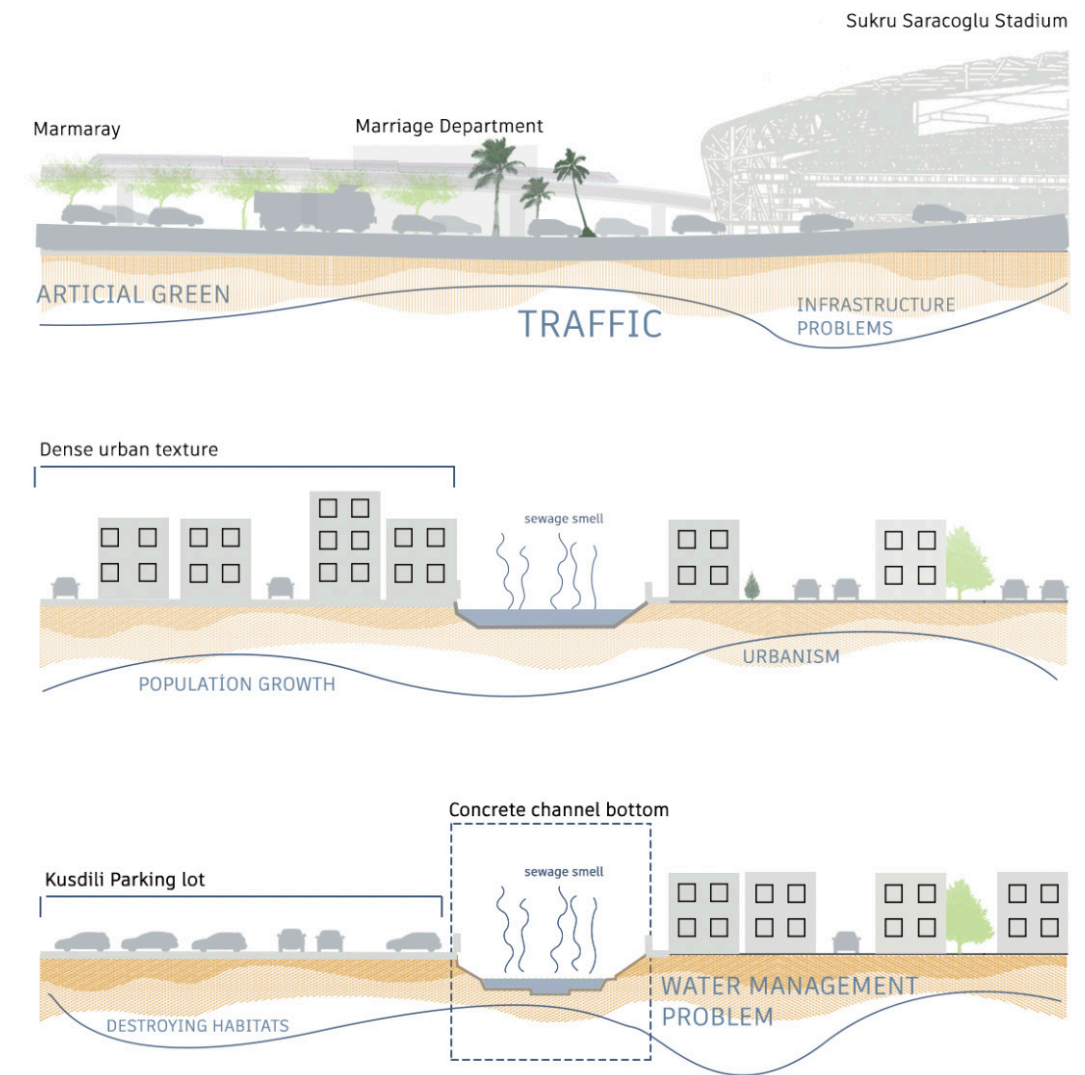

Environmental Impact Characteristics of the Stream Structure

The Unifying Feature of Water

The design of Kusdili Meadow includes a ladder system to provide access to terraces, which will regenerate the coastal habitat and enhance human interaction with water. The meadow area, aimed at reviving the character of Kusdili Meadow, includes a rain garden to filter rainwater collected from the city, allowing it to complete its atmospheric cycle and reach the stream.

For system continuity, the area was planned to serve as a common and stakeholder space. Efforts were made to design spaces catering to stakeholder needs and to increase permeable surfaces in these areas. Ecological niches with wildflowers, which hold significant historical value for the meadows, are positioned in the station area to allow flora and fauna to find habitats again. A feature was designed to allow users to earn points through games at kiosks located at the exits of these niches, which can be used in the exhibition unit. The parking area was restructured with permeable flooring, and a waiting and resting area was created near the river line.

Aim

To **redefine the relationships** by giving water a new and **sustainable** identity with **ecological** and holistic interventions that we will bring by taking advantage of **past experiences** of the **sociality** lost by wrong interventions.

1

TREASURY OF KADIKÖY MUSEUM

The Treasury of Kadıköy museum is home to many hidden intangible and concrete cultural and natural values of Kadıköy. Since Kadıköy is a region on the Bosphorus, it has become one of the oldest settlements in Istanbul. All the historical and cultural values of the event have remained unreadable memory in the place with the current urbanization. The museum aims to reveal this memory of the area and to show the traces of history at the point where the stream ecosystem is interrupted, that is, we cannot follow the water.

Fumaria densiflora

Centaurea kilea

Lamium purpureum L.

Origanum vulgare

Alstroemeria aurea

Calluna vulgaris

TREASURY OF KADIKÖY MUSEUM GARDEN AS ECOLOGICAL VALUE

The ecosystems that develop around the water bring with them different landscape characters. Thematic gardens that will strengthen the memory of the area being on the bank of the stream and the water following the topography to create the meadow ecosystem in this area were proposed. Care was taken to ensure that the plants grown in the gardens are suitable for the local and Bosphorus ecosystem and that they are colorful and fragrant plants that attract birds. These plants also take part in cleaning the water and filtering it before it goes to the stream.

"Re-Water" was produced within the scope of Landscape Design 3 carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Merve Aydın under the title "Un-Tangling the Node of Kadıköy: Infra(structural) Land(scapes)" in the spring semester of 2020-2021.

Project, the Söğütluçeşme region of Kadıköy, one of the oldest historical settlements in Istanbul, is considered. Upper scale analyzes in the region have progressed by holding on to historical readings and inferences, spatial memory and the value of water in the space. By making inferences from the old and new relationship of the region with water, it is emphasized that water is an instructive

element in the region and the basis of the ecological cycle in the design of the area. Aim: To redefine the relationship by giving water a new and sustainable identity with ecological and holistic interventions that we will bring by taking advantage of past experiences of the sociality lost by wrong interventions.

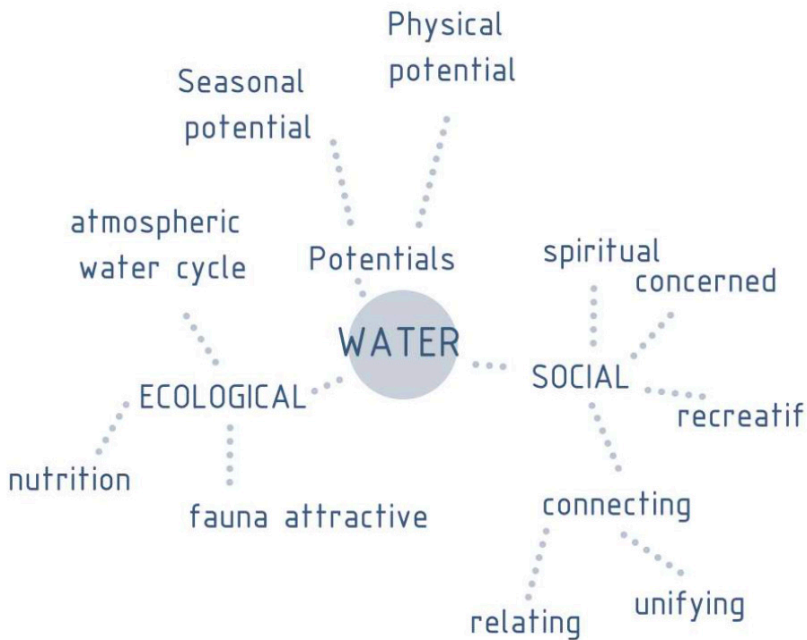

Goals:

- 1. Restoring coastal habitats and ensuring coastal continuity and sustainability
- 2. To restore the binding property of water to the city
- 3. To enable users to play a role in contributing to urban sustainability.
- 4. Managing the field in cooperation with partners and stakeholders in order to ensure the continuity of the system and economic sustainability.

1/2000 upper scale decisions:

- Creating nesting areas on the shore
- Creating rain gardens in the right locations to filter rainwater and ultimately return the water to the stream
- Creating water-friendly borders
- Contributing to the ecological value of the area with different landscape characters
- Creating a continuous shoreline
- Creating informative and interactive coastal habitats
- To determine points in order to provide a participatory role in the field and to support it digitally
- Determine the management scheme of the area
- Rearranging paths for accessibility

TYPE 3

SEASONAL CHANGES IN WATER COLLECTING AREA

Wet season

The rain water in the city is filtered and collected in a clean way in the rain gardens to the water collection area in the square. While at the maximum elevation, the information inside the pool is not read, the pool is seen as reflective.

Interim seasons

In spring, the pool is filled to a certain height and a flora and fauna information is visible. According to the changing water levels, the flora and fauna information of different seasons are revealed in their own season. In this way, the pool is not only a place of experience, but also turns into an ecological teaching through water.

Dry season

During the dry months, the flora and fauna information is fully legible. When there is no water in the pool, the space is an opportunity for performance artists. At night, it creates interesting and safe experience areas in the city square with lighting.

LD III / Un-Tangling the Node of Kadıköy: Infra(structural) Land(scapes)

Let It Flow

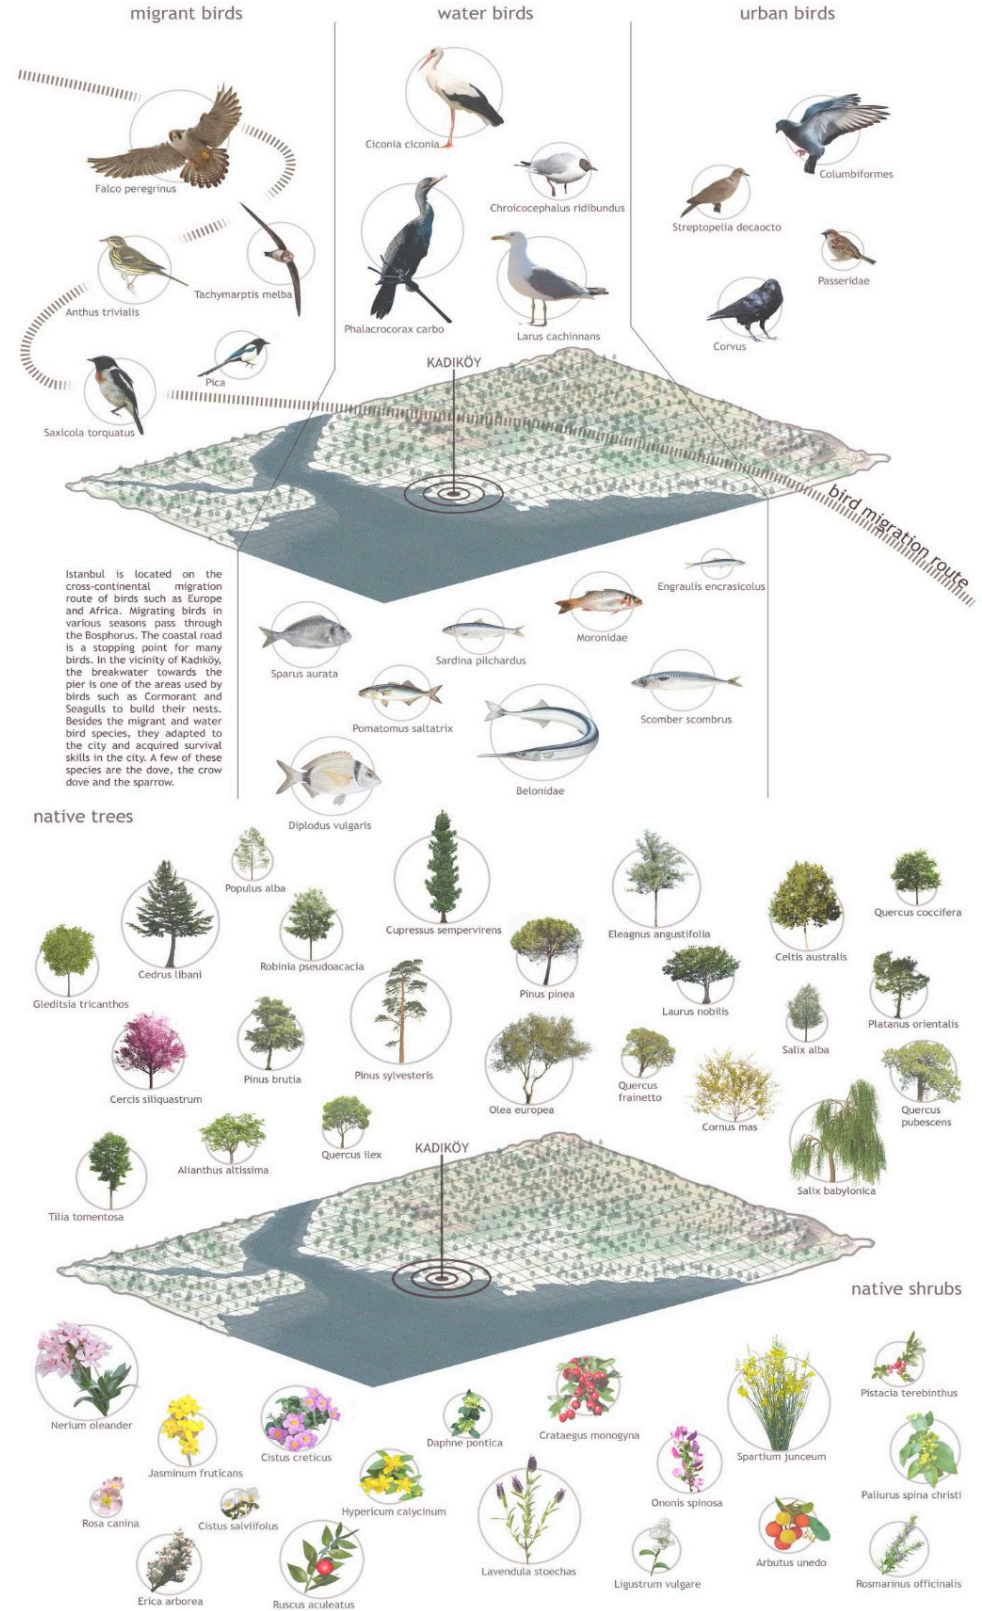

Kübranur Akkabak, Sedef Ülkü Yıldırım, Melike Cemre Okuyucu, Saliha Aydoğar

“Let It Flow” was produced within the scope of Landscape Design 3 carried out by Assoc. Prof. Melih Bozkurt and Res. Assist. Çisem Demirel under the title “Un-Tangling the Node of Kadıköy: Infra(structural) Land(scapes)” in the spring semester of 2020-2021. First part of the project were conducted in a collaboration with parallel studio which carried out by Assoc. Prof. Ebru Erbaş Gürlü and Res. Assist. Merve Aydınli.

BLUE - GREEN SYSTEM RELATIONSHIP ON KURBAĞALIDERE

One of the important elements of Kadıköy and Söğütluçeşme is Kurbağalidere. The blue - green system along the stream line is divided by various hardscapes. Car parks and intersections are the main factors in dividing this system. It is also necessary to consider social life with the blue-green system. In addition, the main roads and highways that go along with the stream line cause the interruption of social life. While there is vehicle continuity along the stream line, there is no pedestrian continuity. It also has no human water connection.

SOCIAL FLOW

There seems to be a strong social flow in this region, as there are cultural venues in the area and it is a transportation node.

TIME FLOW

In public spaces, people spend most of their time in the Moda Beach, Yoghurt Park and Kadıköy Bazaar area. Various transportation stops such as Kadıköy dock area and Söğütluçeşme are considered as areas where there is rapid movement and people come and pass.

NATURAL FLOW

It was observed that the green areas and the stream that provided the natural flow in the region were interrupted in various places.

CIRCULATION FLOW

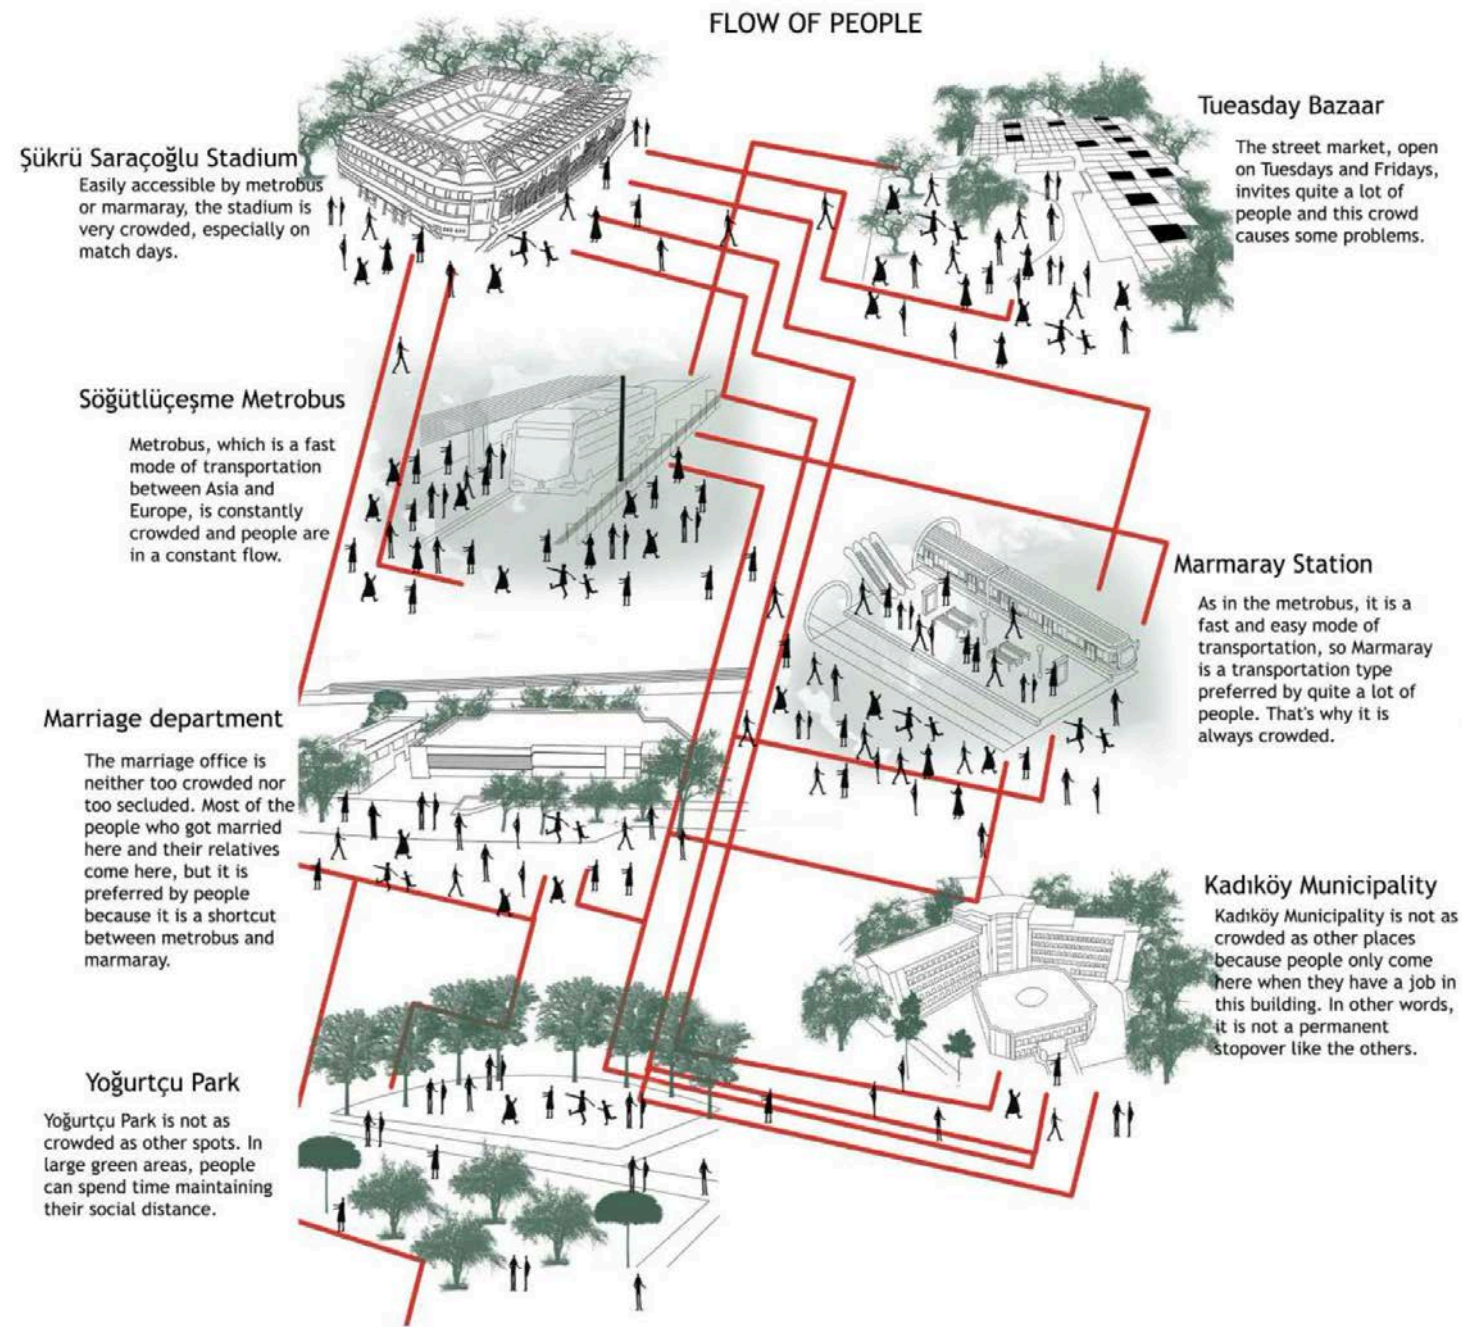

The points where various transportation vehicles intersect form the nodal points. In addition, the bicycle path on the coastal road is interrupted.

ECONOMIC FLOW

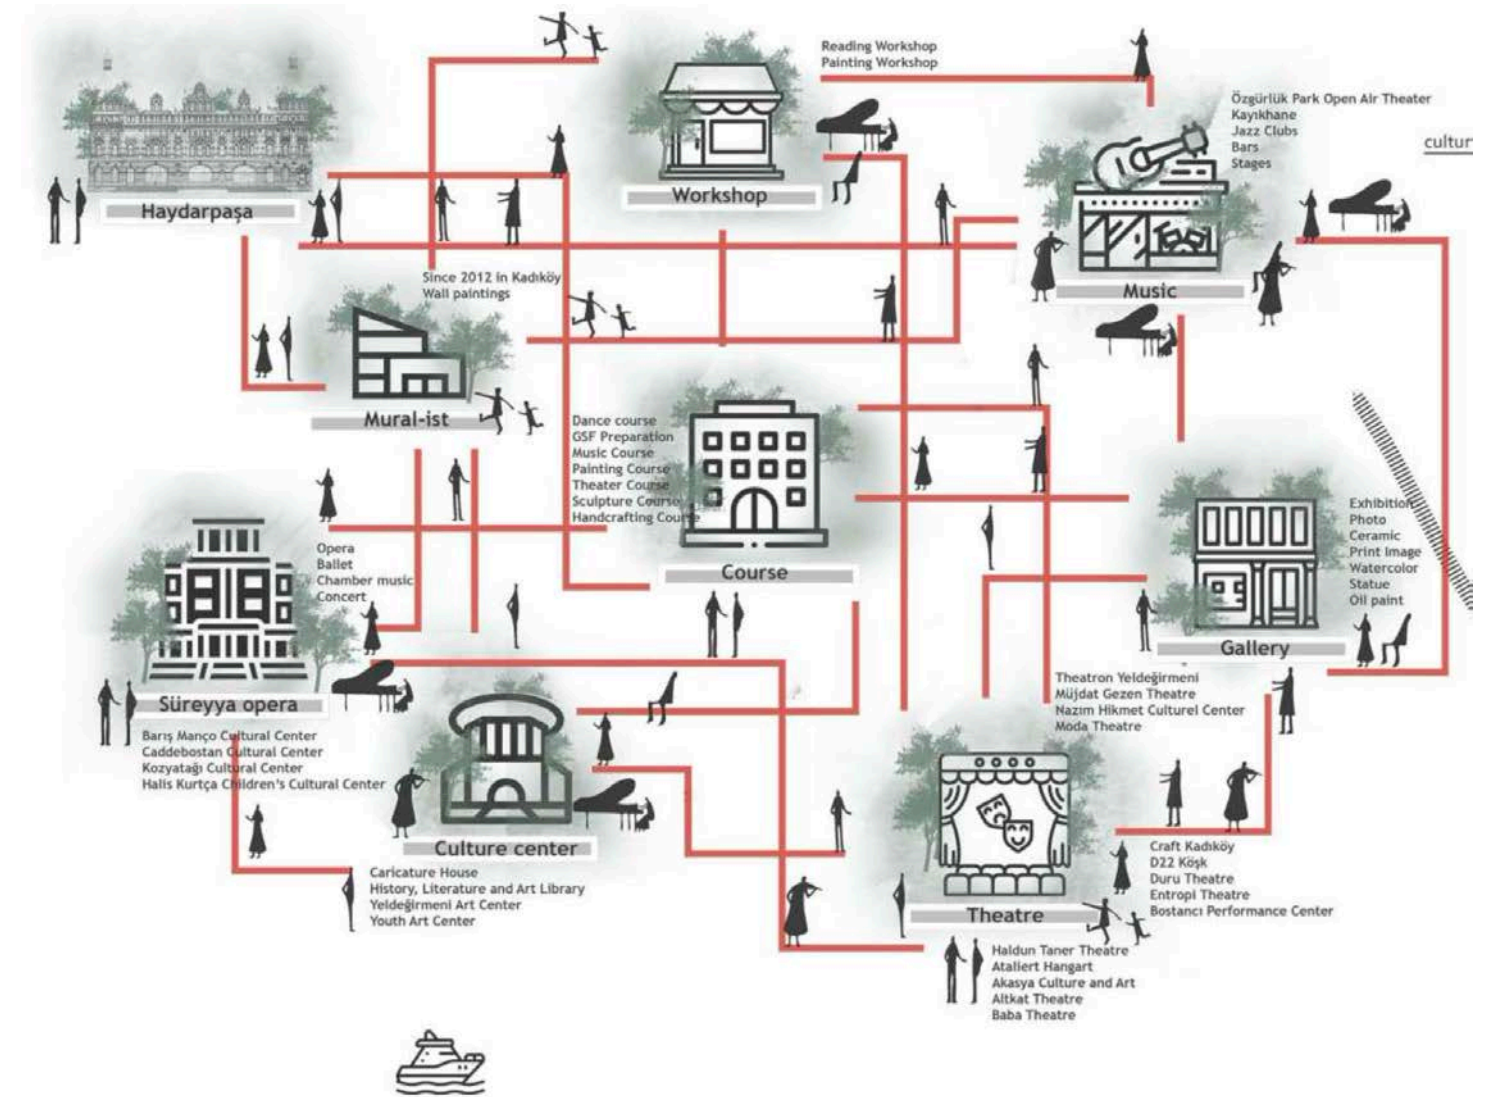

Shopping centers, marketplaces and bazaar areas in the area were considered as elements forming the economic flow.

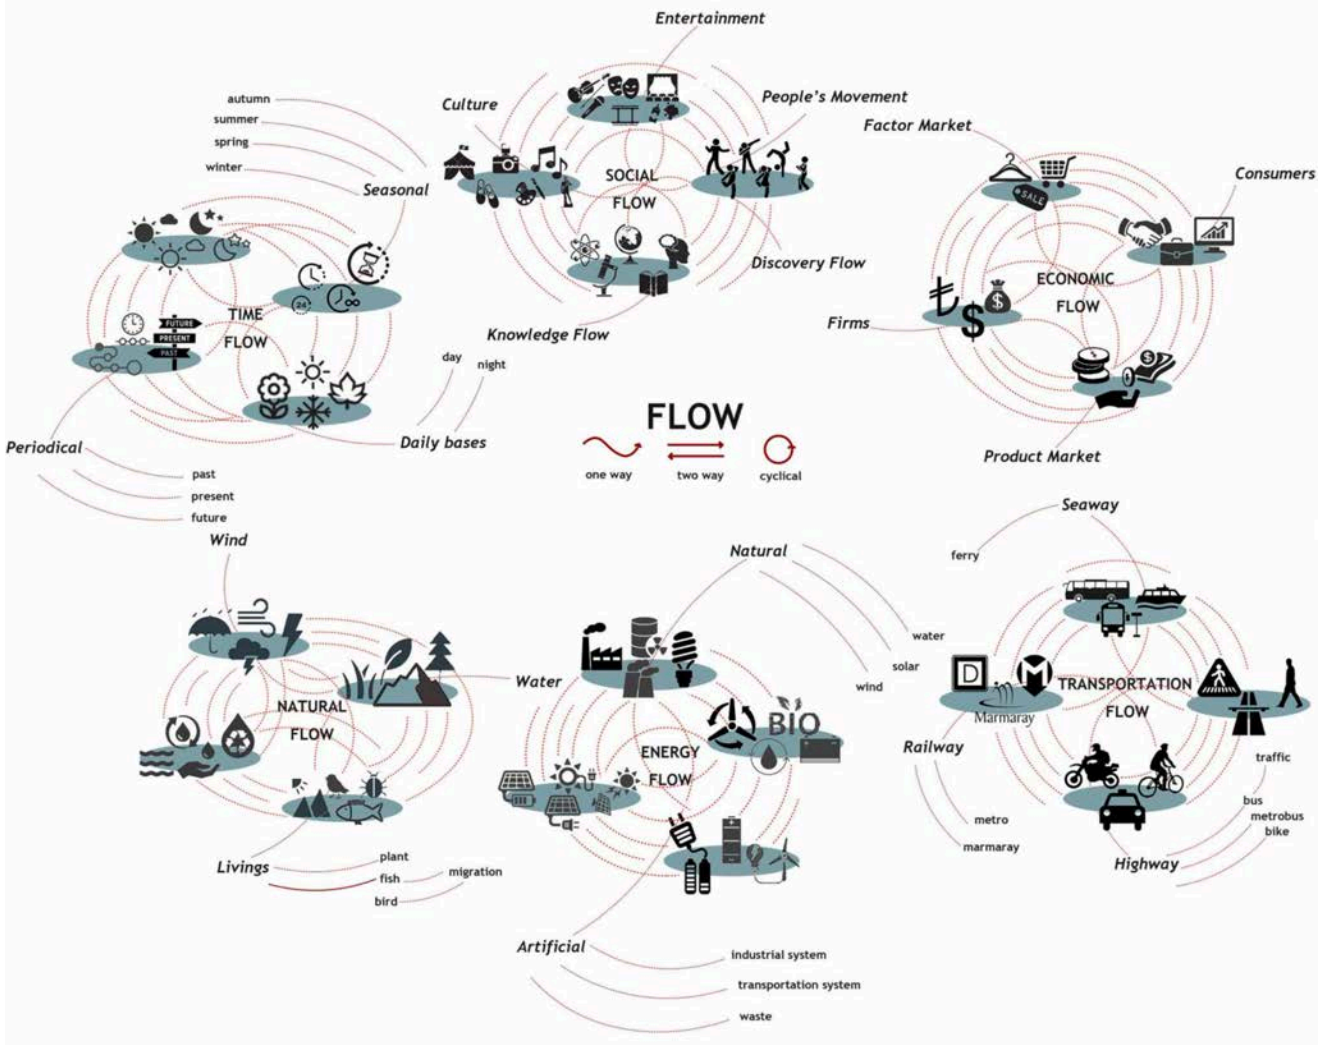

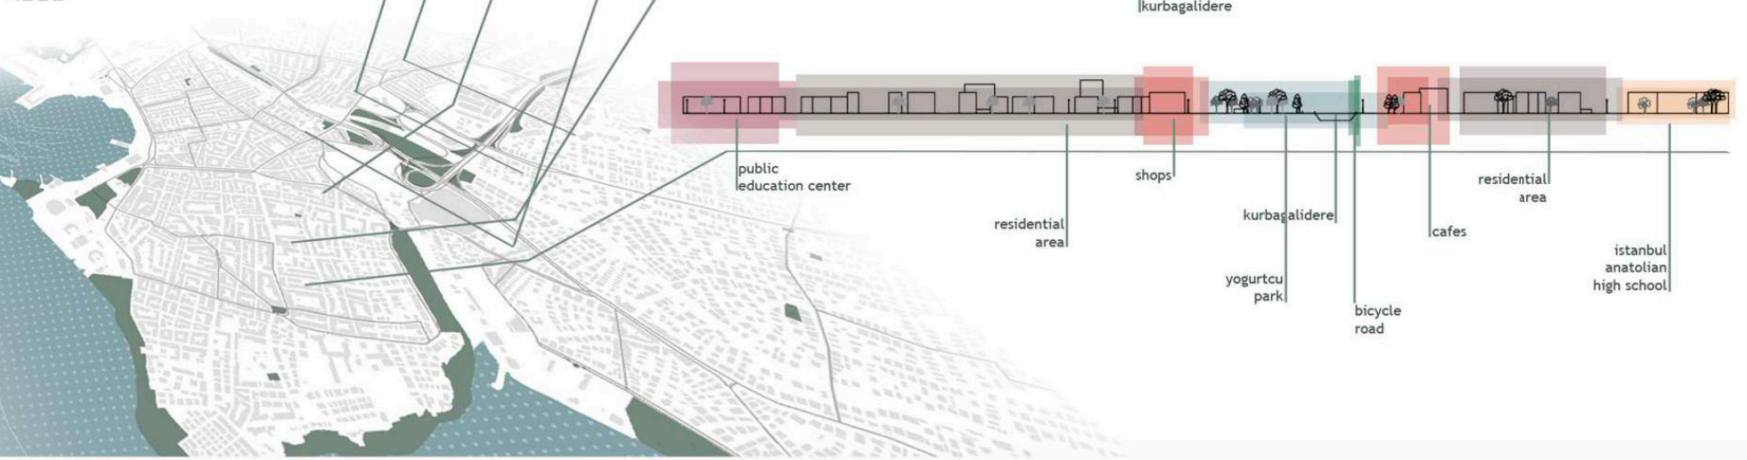

When examining the history, memory, and local culture of Kadıköy, it becomes evident that it has a multi-layered structure. With its social fabric, transportation hub, and characteristic environment, this region was approached through the concept of flow. The area was analyzed using sub-concepts such as natural, social, circulation, economic, energy, and time flows that support this flow concept, and recommendations were made accordingly.

The project's aim was to enhance urban flow by eliminating the disconnection between spaces, activating idle areas, and creating more ecological zones. Various sub-strategies were identified to support this aim. These strategies include ensuring accessibility and circulation flow, improving water management, promoting biodiversity, creating multi-functional areas, and ensuring public safety.

Additionally, more ecological and recreational creek sections were proposed for Kurbağalidere, which forms the memory and character of Söğütlüçeşme. To protect the upper-scale decisions and conceptual approaches, the focus was on social flow and pedestrian circulation at the lower scale. Pedestrian circulation was designed based on the axes from Yeldeğirmeni, Kadıköy, and Hasanpaşa, aligning with the circulation between sub-spaces in the region. Key concepts here included movement, density, stopping points, and road directions. The spaces were designed by constructing intensive circulation between main spaces and experiential circulation between sub-spaces.

- ECONOMIC FLOW AREA
- TRANSPORTATION FLOW AREA
- SOCIAL FLOW AREA
- NATURAL FLOW AREA
- SERVICE INDUSTRY
- RESIDENTIAL AREA
- FLOW INTERRUPTION

Due to the heavy pedestrian flow to the Marmaray region, a main axis was established there, with surrounding spaces evaluated according to the potential of Kadıköy and the Marmaray Bridge. Skateboard culture and wall murals reflecting Kadıköy were incorporated under the bridge. For security under the bridge, cafes and kiosks were designed to ensure an evening presence of people. Since the area between the cafes is situated between transportation hubs like Marmaray Bus and Metrobus, transition areas were expanded to allow better circulation, and seating and waiting areas were designed. These areas include thematic gardens, such as perennial gardens, offering different experiences and inclining walls for leaning and lying down. Additionally, pockets in some areas enhance mutual communication for crowded groups. In the Kurbağalidere creek line, starting from Yoğurtçu Park and continuing through Kuşdili Meadow, wooden platforms were used to enhance interaction with the stream, continuing the design language. Plant groups that leave gaps and emerge from the stream section were designed, allowing users different experiences at the upper level. Considering the Marmaray station area as a large square, a ladder and ramp system was designed using the area's level difference and slopes. An area for high-speed train passengers and a parking lot were designed for waiting cars.

OBJECTIVES

01. ENSURING ACCESSIBILITY

1.1. Enhancing accessibility to spaces

1.1.1. providing access to the stream by a ladder or a ramp

1.1.2. eliminating fences

1.1.3. counteracting car parks

1.2. Enhancing walkability through pedestrian oriented circulation

1.2.1. integrating buffers (planting lanes, street parking or bike lanes) into bustling traffic

1.2.2. Increasing the existence and quality of the paths

1.2.3. providing continuity on pedestrian axle and bicycle path

A new ramp and staircase system was designed while preserving the existing Metrobus underpass. Considering the ecological and recreational potentials of the former parking lot, a waiting area at the Metrobus exit and an amphitheater for open-air shows were created. The design allows circulation from the Metrobus exit to this area, enhancing the back of the amphitheater. Additionally, a meadow texture for leisure and wooden platform spaces were created, continuing the stream section's design language. At a larger scale, the function of the town hall was changed to a cultural center. Areas for activities on both hard and soft floors were designed. A program for installation exhibitions and festivals,

such as Mural İstanbul, Kad Fest, Jazzfest, and Sanatparkta festival, was organized. The Atatürk monument area was refunctioned as a square. Reflective water surfaces that collect rainwater from the cultural center roof highlight the mural paintings. The area between the cultural center and transportation hubs continued the bridge's design language with various seating and rest units. Green surfaces at different levels were designed using walls and slopes. An area was also created where products from cultural center workshops could be exchanged and exhibited monthly. Finally, an underground parking garage was designed with slope calculations for the entrance.

02. STRENGTHENING THE SOCIO-ECOLOGICAL INFRASTRUCTURE

2.1. Developing water management

2.1.1. creating river buffers

2.1.2. creating bioswale fields

2.1.3. creating vertical farming

2.1.4. creating permeable surfaces

2.2. Enhancing biodiversity

2.2.1. enhancing diversity through native landscaping

2.2.2. creating habitats for human-damaged populations

2.3.1. designing areas that attract to all ages

2.3.2. integrating multiple activities into areas

2.4. Ensuring public security

2.4.1. utilizing lighting elements

2.4.2. guiding people with signs and maps

2.4.3. offering action options

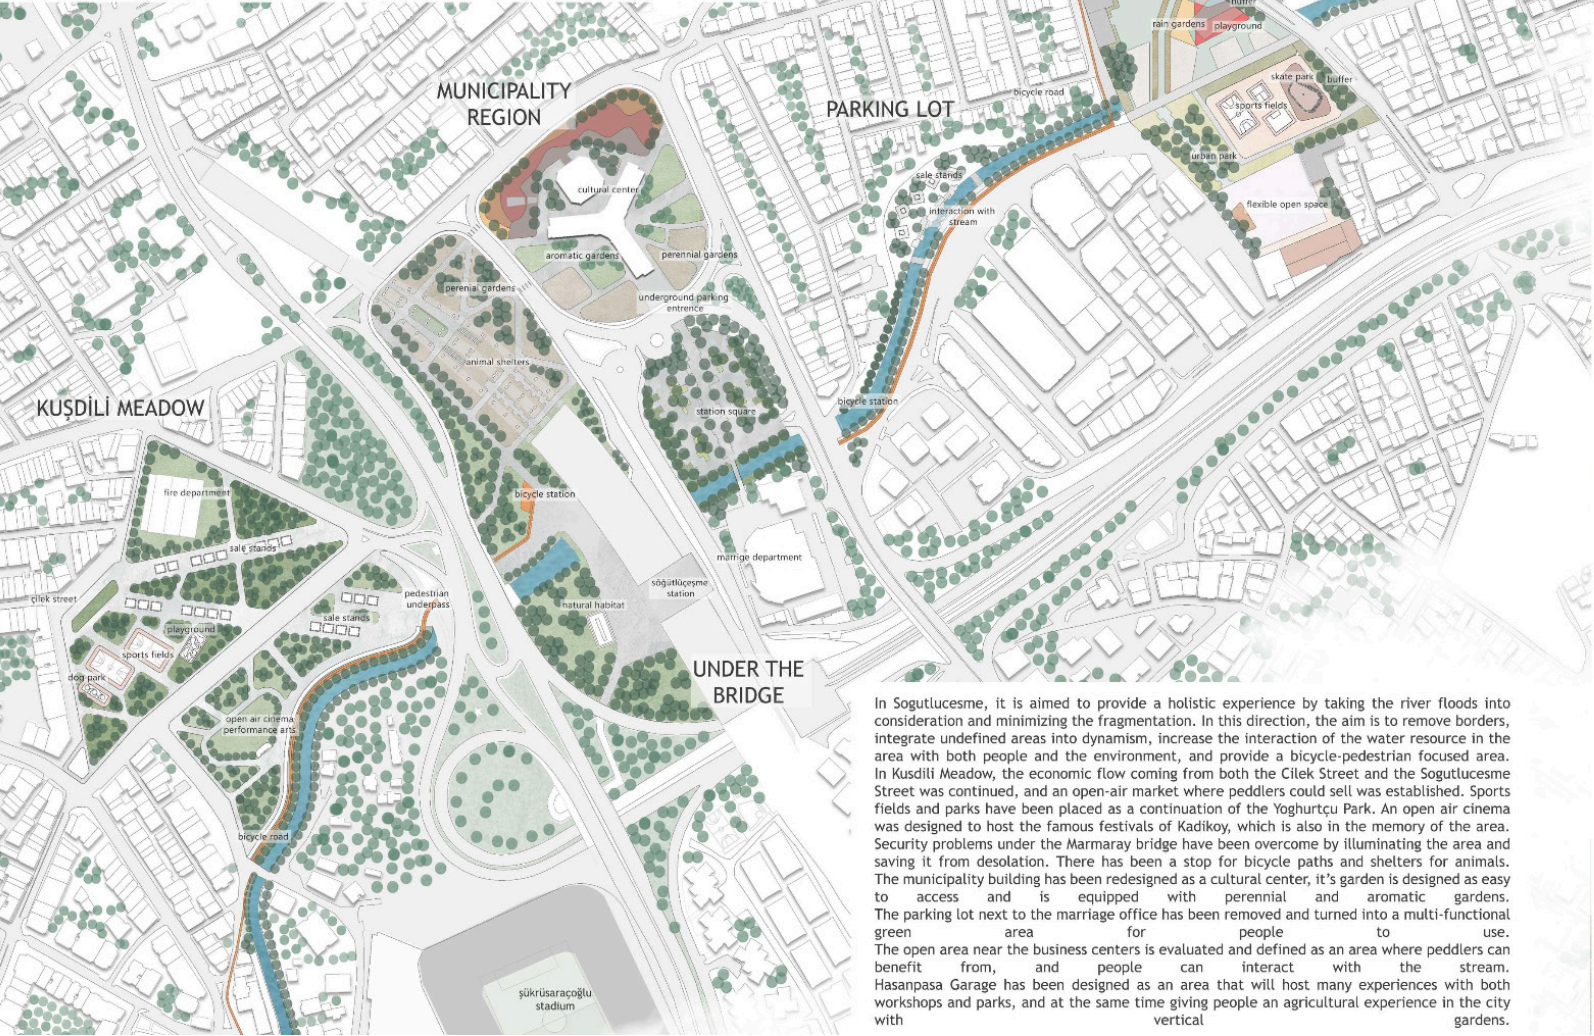

2.4.4. providing vegetative design and management (field of view)

FUNCTION AND PROGRAMME DIAGRAM

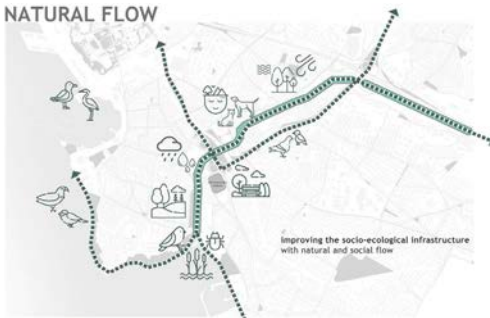

Stream sections were changed in various parts of the design that progressed along Kırbağalidere in the study area. The sections vary in Kuşdili Meadow, Söğütluçeşme Marmaray station and where the old car park was located. In some places the flow between man and water was providedStream sections were changed in various parts of the design that progressed along Kırbağalidere in the study area. The sections vary in Kuşdili Meadow, Söğütluçeşme Marmaray station and where the old car park was located. In some places the flow between man and water was provided by plants and sometimes by removing borders.

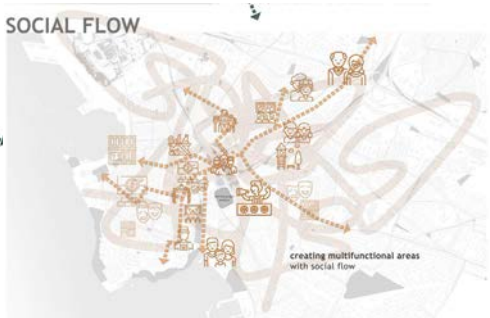

In Söğütluçeşme, it is aimed to provide a holistic experience by taking the river floods into consideration and minimizing the fragmentation. In this direction, the aim is to remove borders, integrate undefined areas into dynamism, increase the interaction of the water resource in the area with both people and the environment, and provide a bicycle-pedestrian focused area. In Kuşdili Meadow, the economic flow coming from both the Çilek Street and the Söğütluçeşme Street was continued, and an open-air market where peddlers could sell was established. Sports fields and parks have been placed as a continuation of the Yoghurtcu Park. An open air cinema was designed to host the famous festivals of Kadıköy, which is also in the memory of the area. Security problems under the Marmaray bridge have been overcome by illuminating the area and saving it from desolation. There has been a stop for bicycle paths and shelters for animals. The municipality building has been redesigned as a cultural center, its garden is designed as easy to access and is equipped with perennial and aromatic gardens. The parking lot next to the marriage office has been removed and turned into a multi-functional green area for people to use. The open area near the business centers is evaluated and defined as an area where peddlers can benefit from, and people can interact with the stream. Hasanağa Garage has been designed as an area that will host many experiences with both workshops and parks, and at the same time giving people an agricultural experience in the city with vertical gardens.

> **Green System & Blue System & Human / Separation Dissolution**

Formerly Yogurtcu Park

From touching the water, being able to feel it,

Formerly KUSDILI Meadow

being able to experience it, interact with it;

Today's Yogurtcu Park

To pass by,

Today's KUSDILI Meadow

or not even being able to pass and see the water.

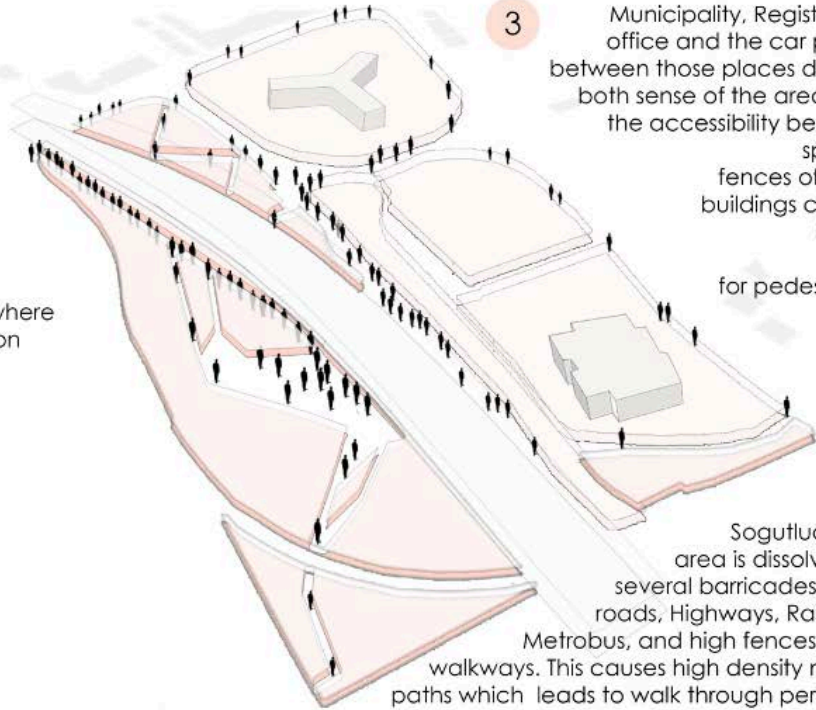

> **Human & Grey Infrastructure / Separation Dissolution**

1 Salıpazarı area is divided into two segment where both of them hinders the people's penetration

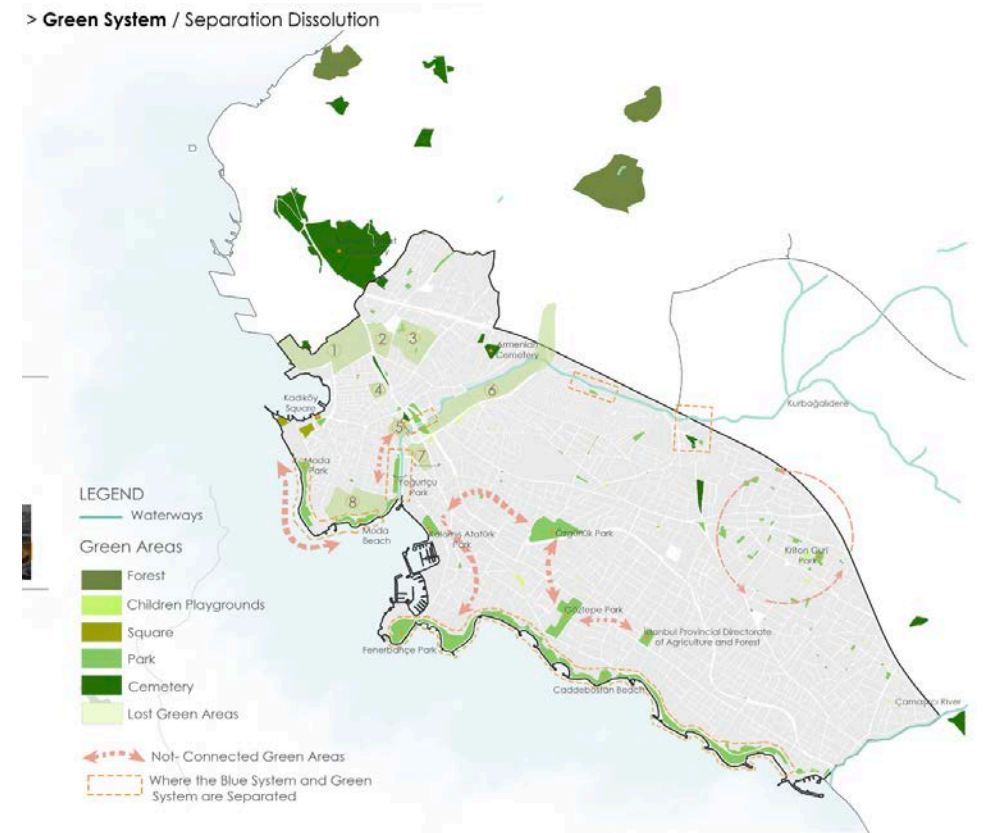

>Inaccessibility at the areas creates congestion hence increase the density at the walk ways. This inaccessibility dissolves the integration in between spaces.

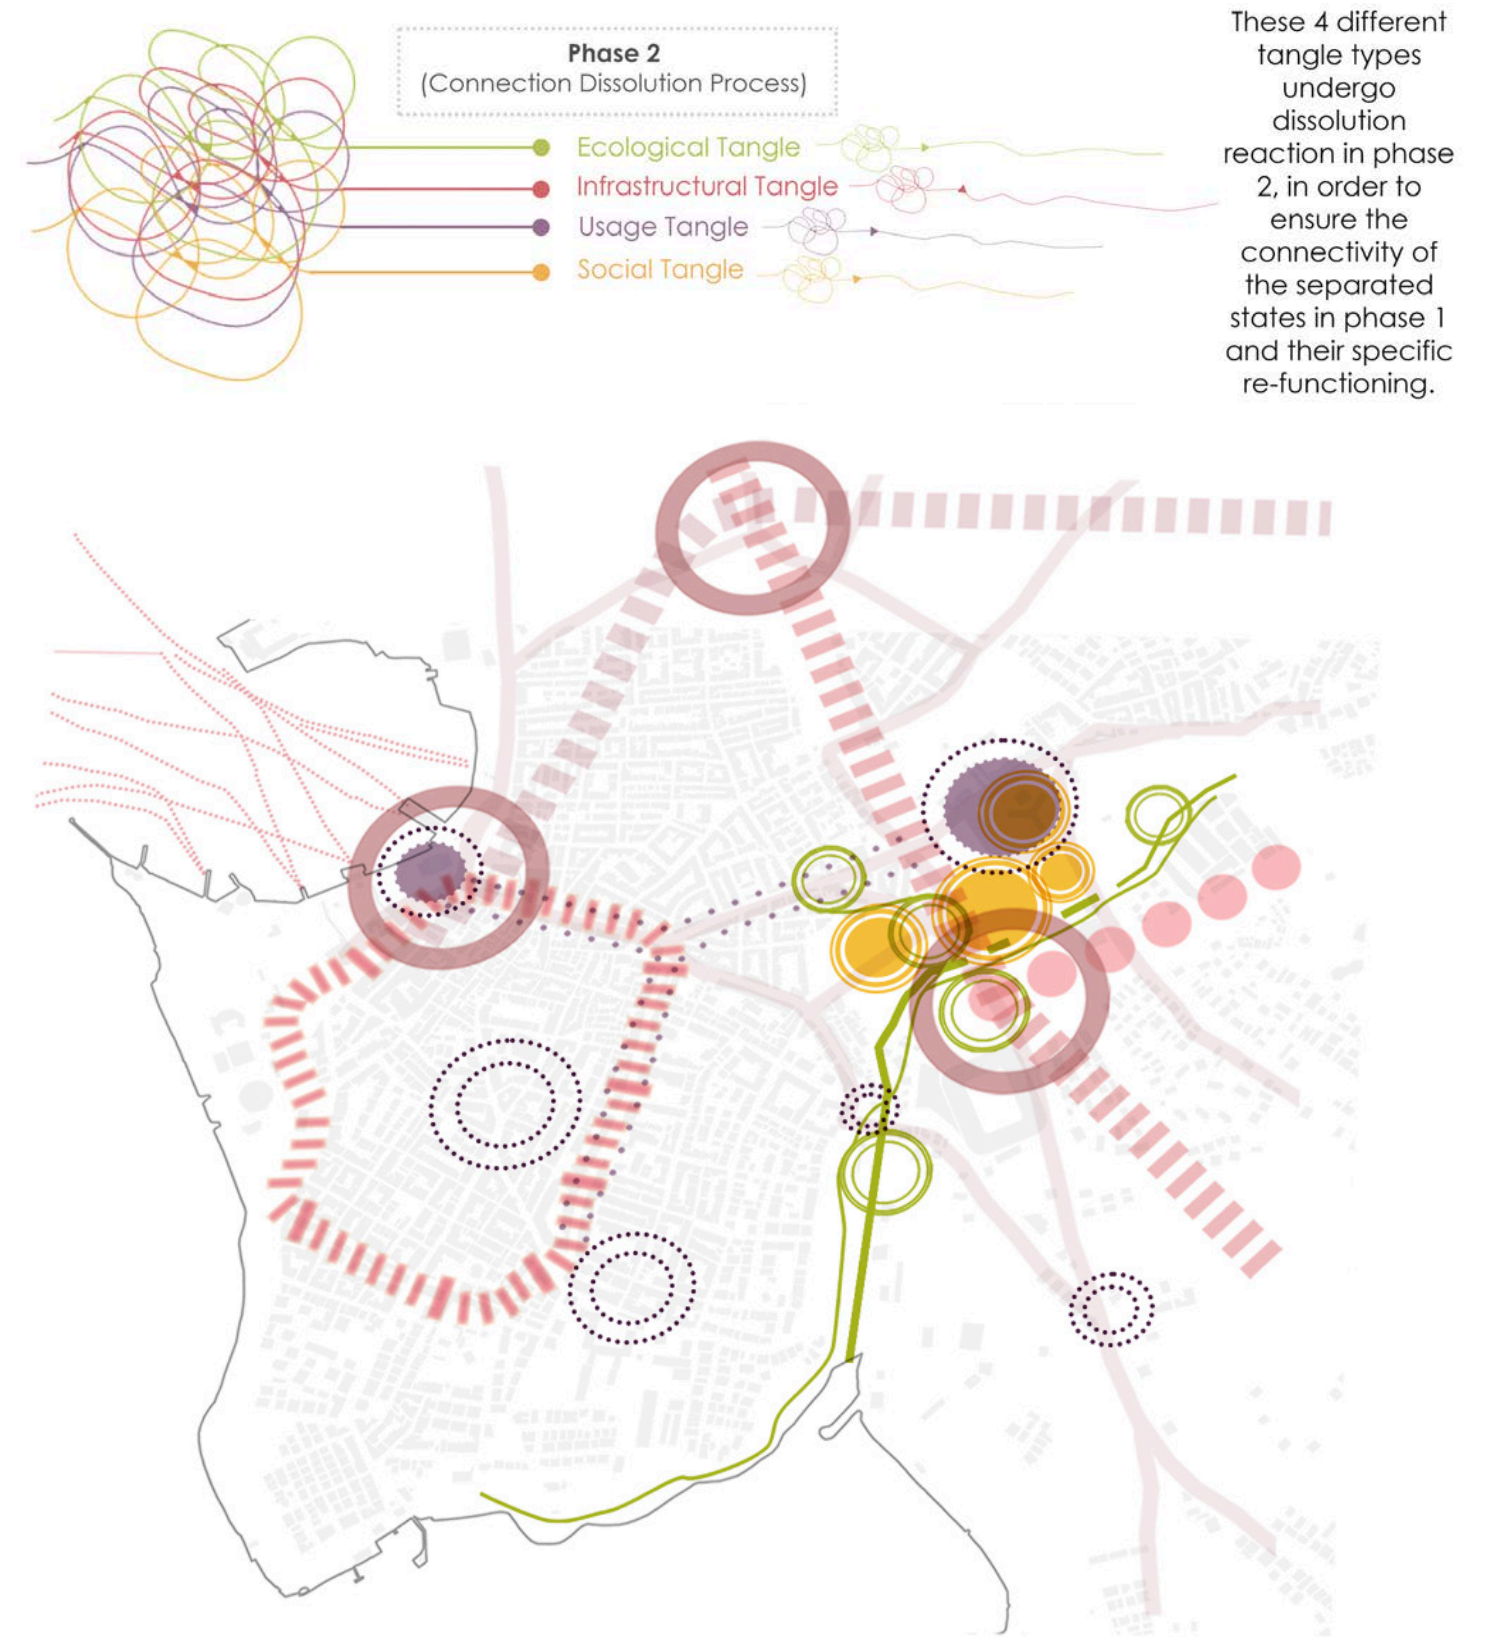

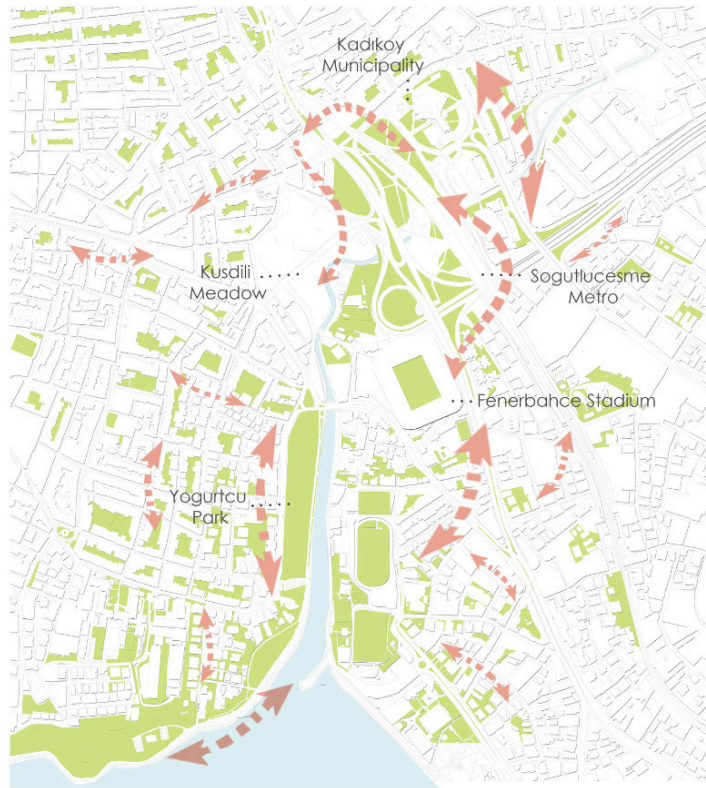

3 Municipality, Registration office and the car park in between those places dissolve both sense of the areas and the accessibility between spaces. fences of these buildings creates barrier effect for pedestrians.

2 Sogutluceme area is dissolved by several barricades: Wide roads, Highways, Railways, Metrobus, and high fences within walkways. This causes high density narrow paths which leads to walk through perimeter

While there are dissolved green systems in the inner parts of Kadiköy on the upper scale, we see that the coastline still managed to maintain its continuity. When examined in closer scale, it is seen that the green areas in the inner regions are dissolved from each other and work completely independently, while the stream line has a certain continuity.

> **Ecological Tangle** / Connection Dissolution

The reasons for the existence of the ecological tangle

- A stream that people can't interact with, Access problem to the stream
- Inability to clean oneself
- Inability to work together with the green system and become a binding factor
- Pollution and bad smell
- Transport of garbage from the sea to the stream

Streets that caused the not formation of the green system

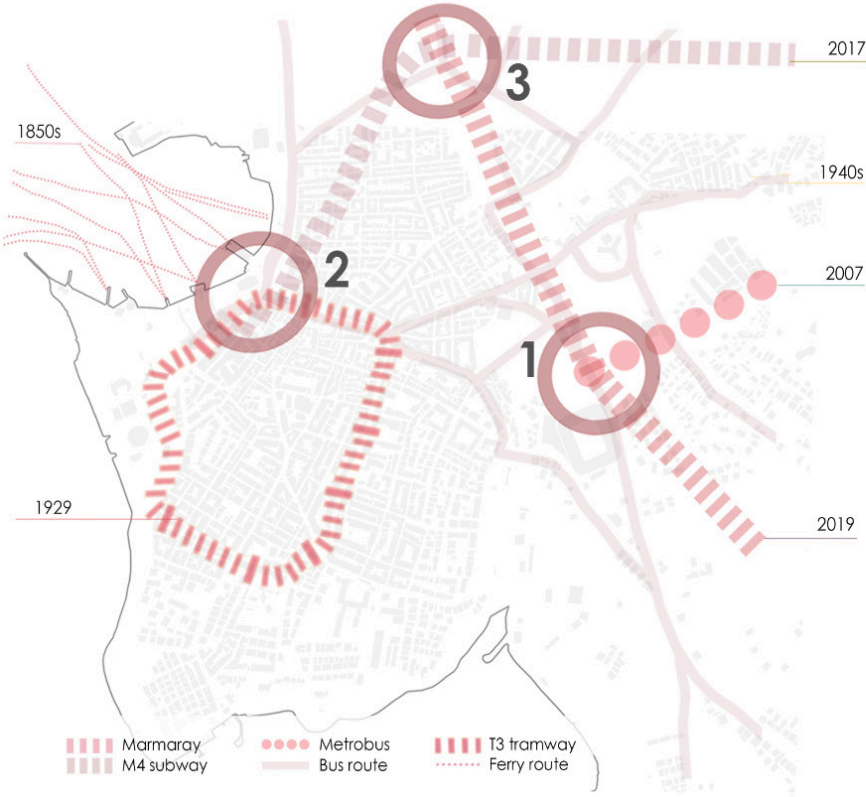

The inability of this area, which has an ecological potential, to participate in the green system due to the intense parking area

Loss of ecological value with the restriction of the blue system
Failure to maintain the continuity of the green system around the blue system

> **Infrastructural Tangle** / Connection Dissolution

Sogutlucemesi tangle
Sogutlucemesi is one of the main junction point for transportation: Marmaray, Metrobus and bus route intersect in here.

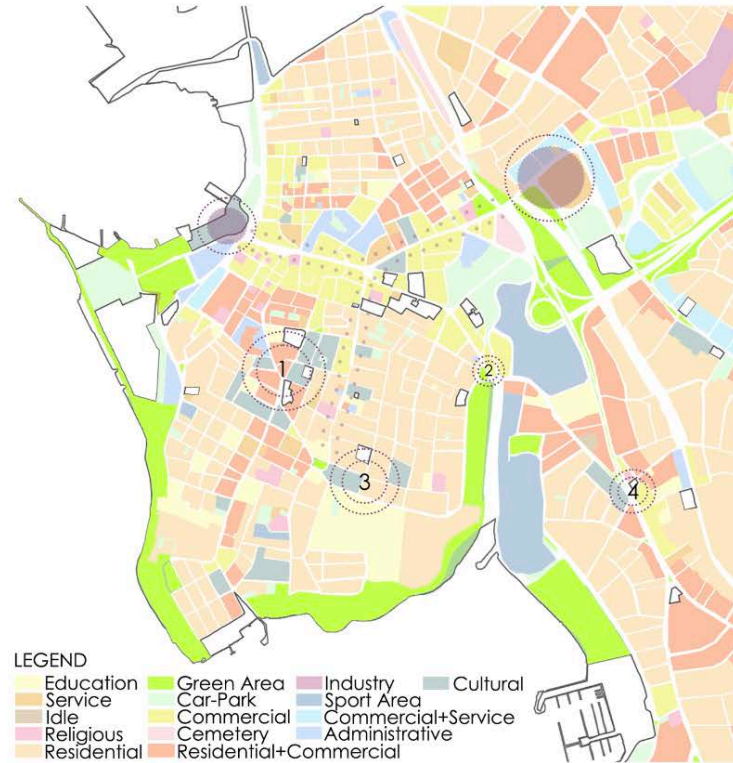

Rihtim tangle
Kadikoy rihtim is a main junction point for transportation, and for meetings: Subway, ferry, and main bus station intersect in here.

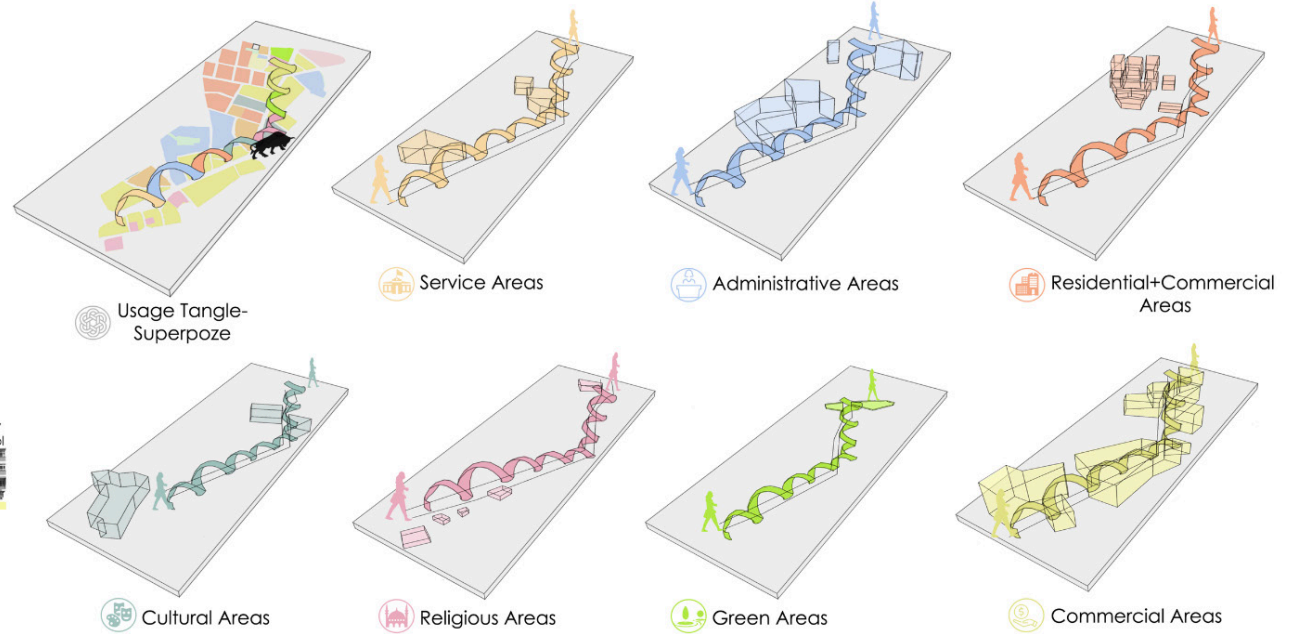

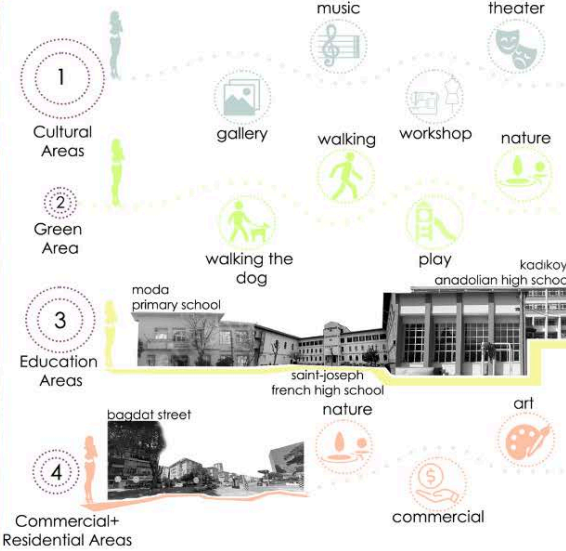

Ayrikcesmesi Tangle
Ayrikcesmesi is an another key junction point for transportatin: Marmaray and Subway are connected here underground.

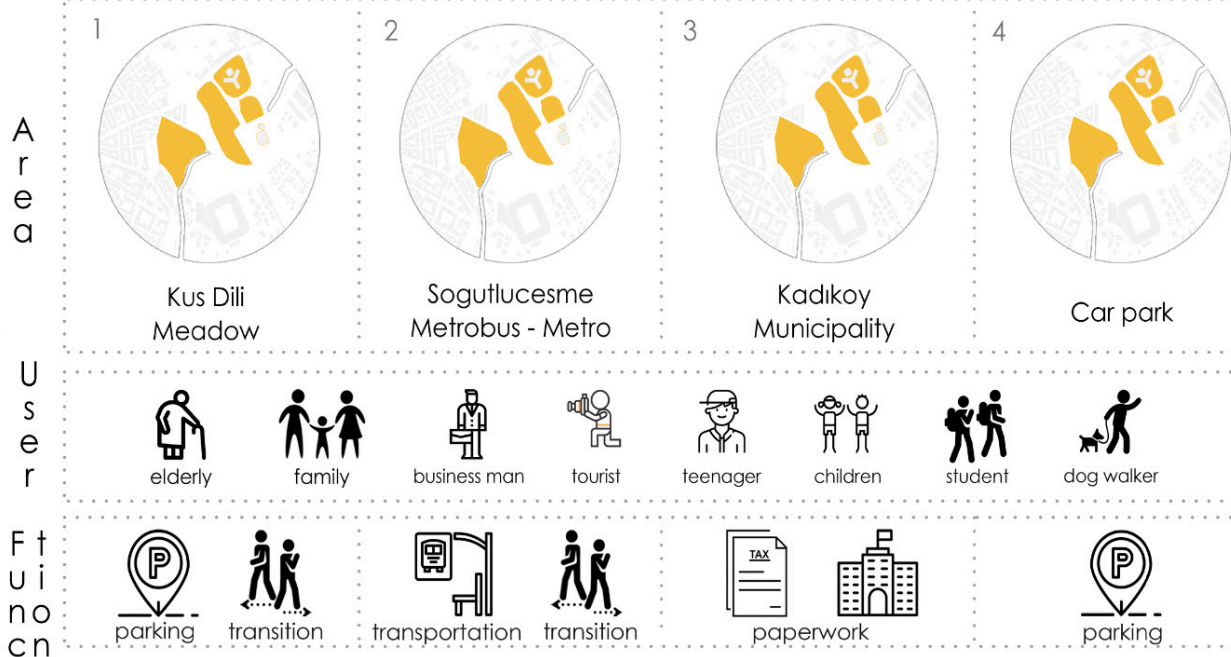

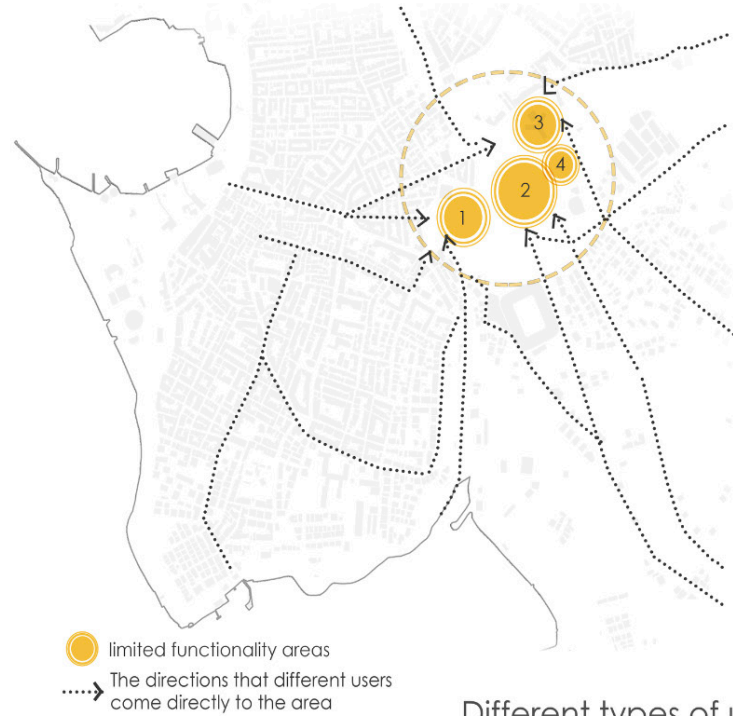

> Usage Tangle / Connection Dissolution

The fact that the areas with many area usage functions do not have a certain axis but are completely dissolved from each other, as well as the convenience provided by Söğütöçesme Avenue in terms of transportation and many field functions, this axis is used as the main axis and forms a node.

> Social Tangle / Connection Dissolution

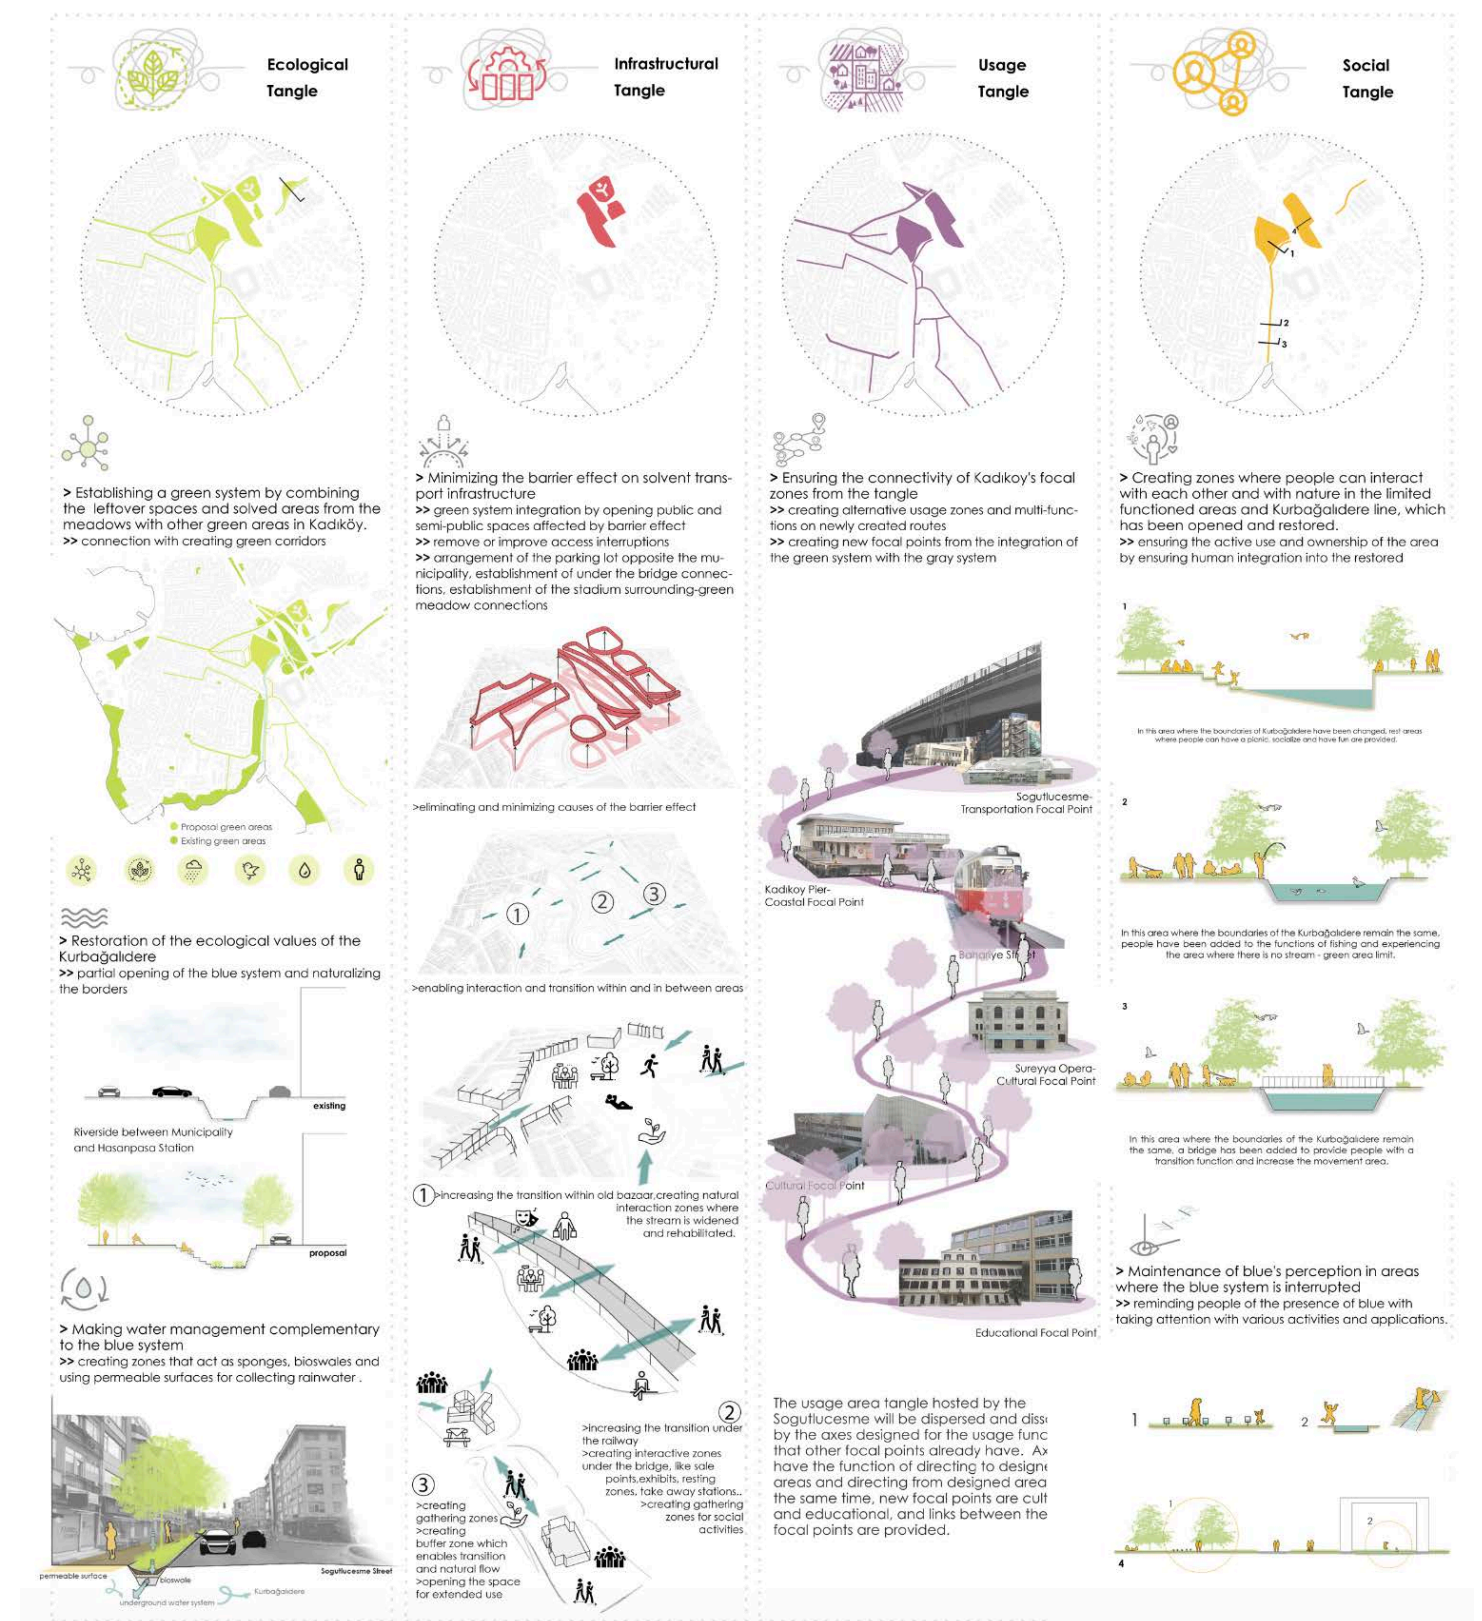

Different types of users and limited functionality causes the area to be stressful and creates a tangle.

Aim	Goal	Relation type	Tangles	Strategies	Functions	Users
Solving the tangle in the context of the dissolution process by the simultaneous operation of the situations identified in phase 1 and phase 2, thus establishing the relations in the area.	- Improving the unifying infrastructure potential of the area's history and restoring its ecological values.	Macroscopic (visible)	Ecological	Green System River restoration Water management	nature park walking transition sitting picnic meeting playground fishing entertainment	elderly family
	- Refreshing the memory of the city with the reinforced perception of space and bringing the tangle actively to daily life. Transformative Water

Rebeka Kayakoparan, Nergis Şenkaya, Aybüke Yarbasan, İrem Özdeş

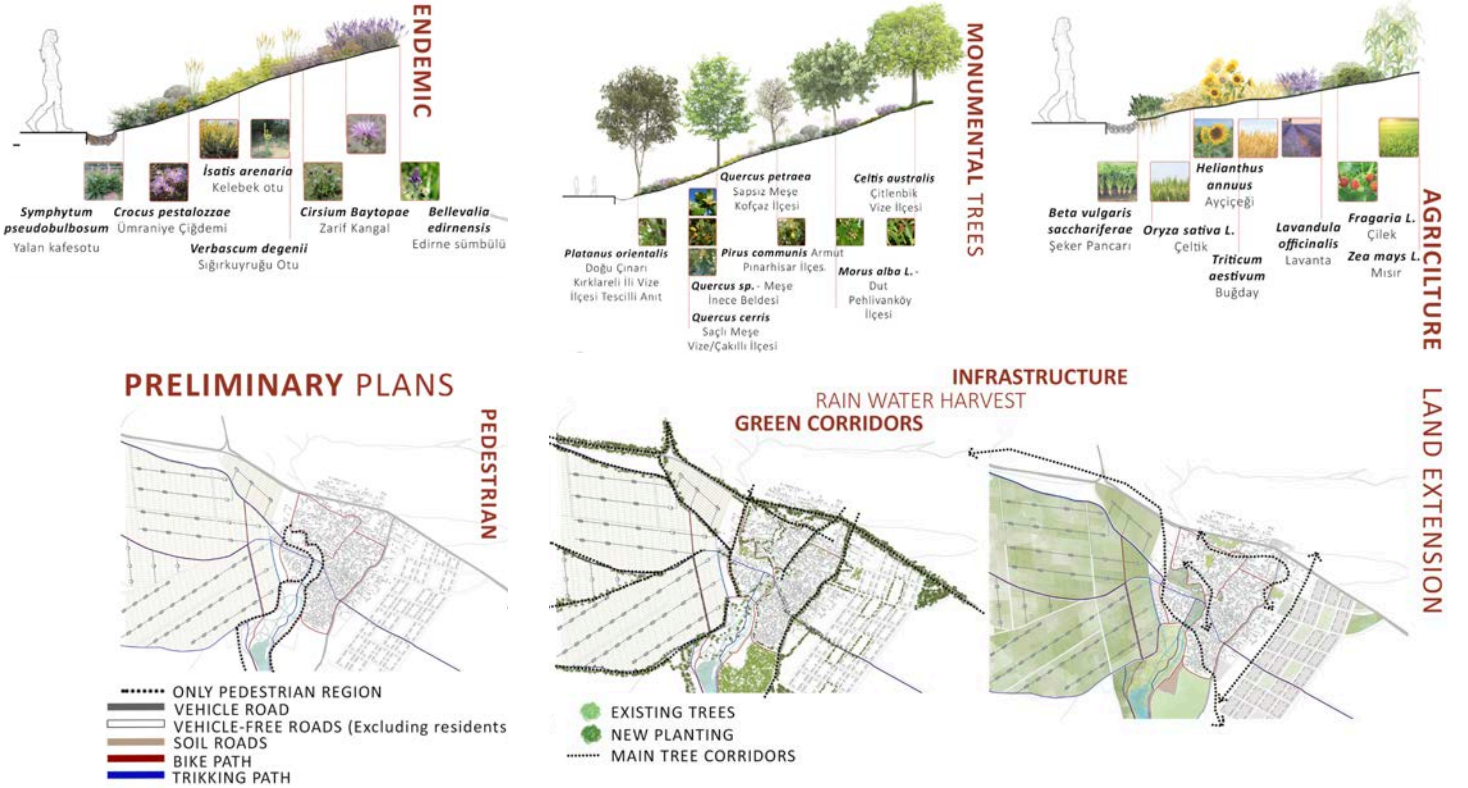

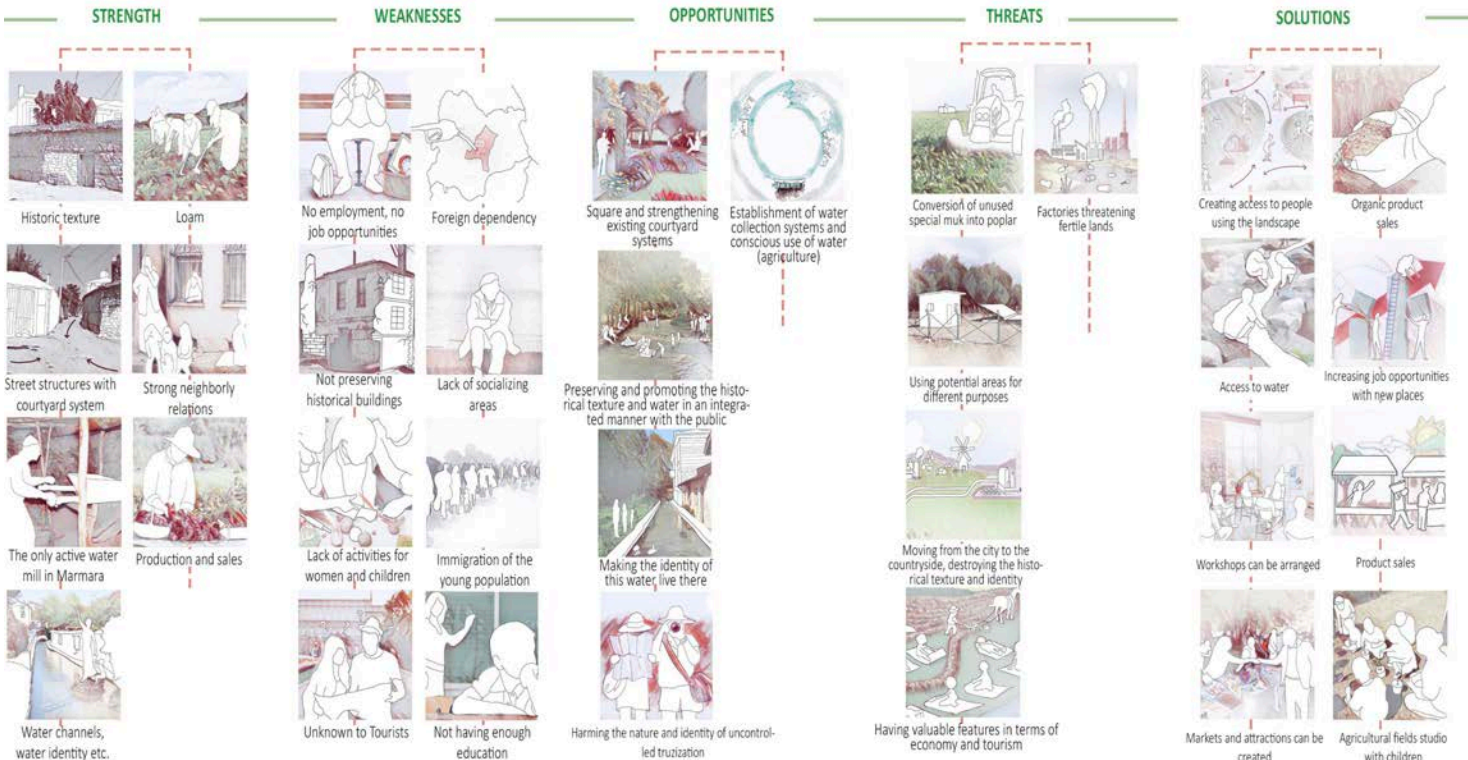

“Transformative Water” was produced within the scope of Landscape Design 3 carried out by Assoc. Prof. Melih Bozkurt and Res. Assist. Fatma Sultan Yaman under the title “Virissis Verissa: post][new landscape scenarios for Kırklareli” in the spring semester of 2021-2022.

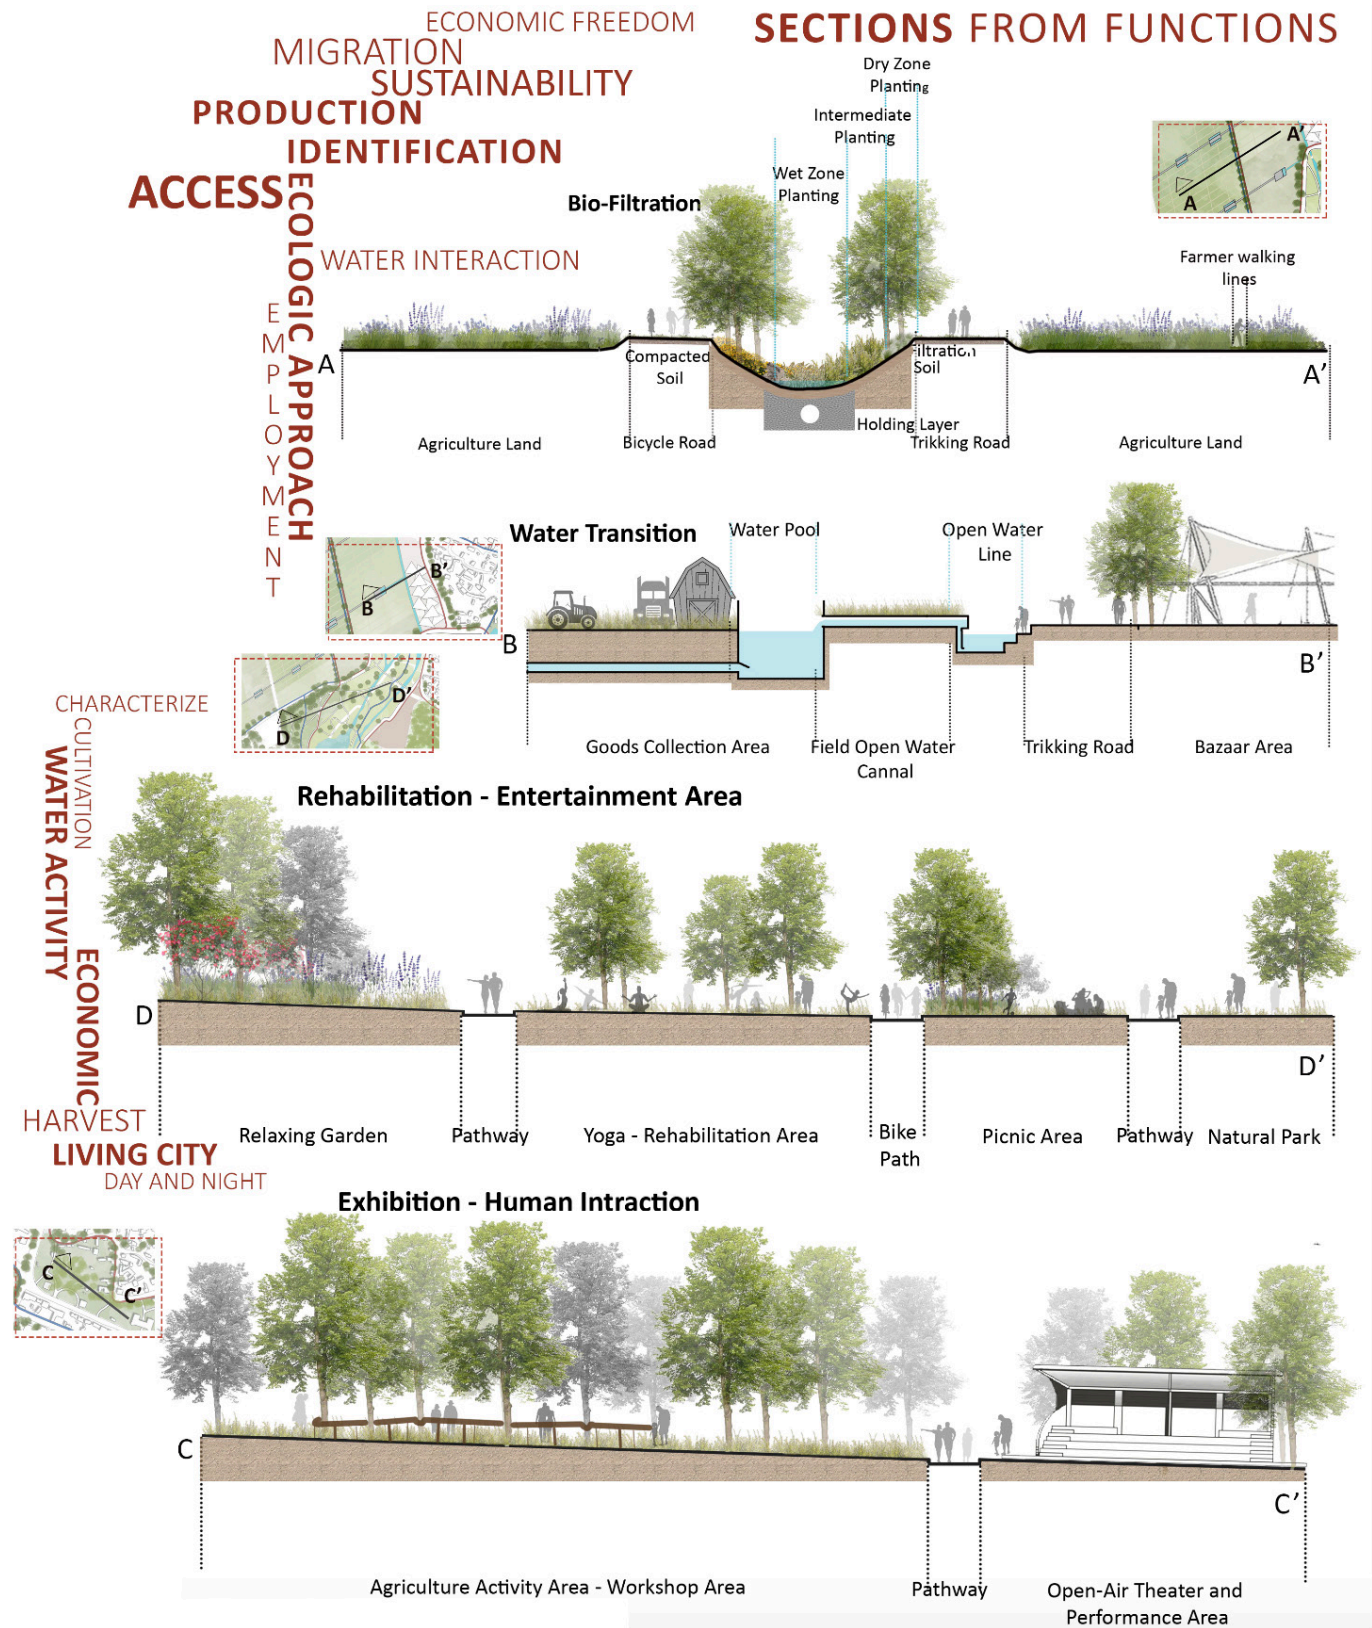

The analysis, synthesis and master plan phases of the study were produced as a group work consisting of Rebeka Kayakoparan, Nergis Şenkaya, Aybüke Yarbasan and İrem Özdeş.

The project area, Kaynarca, is connected to the Pınarhisar district of Kırklareli and is located along the intercity road lines. Although Kırklareli Pınarhisar village has rich opportunities and a unique identity, it relies on Istanbul and the surrounding districts for essential needs such as job opportunities, school services, and health facilities, which are insufficient in the village.

The identity and characteristics of Kaynarca are shaped by its history and local people. The area's history dates back to 515 BC. During his expedition to Scythia, the Iranian ruler Darius stayed with his army next to the boiling rivers. Darius liked this place so much that he had a column erected at the head of the water. He even said, “Just as Darius is the ruler of this world, the waters of Kaynarca are the rulers of the waters.” Based on these words and its history, it is evident that the waters of Kaynarca are the most significant factor in shaping the identity of the place.

Aim: Transforming space through different uses of water.

First and foremost, agricultural lands are developed and made usable by heating the water. This approach provides employment, boosts the economy, reduces out-migration, and fosters the development of the rural city. Consequently, various functions within this field are enhanced. With these improvements, people's quality of life is elevated, and new settlements are expanded in a planned manner.

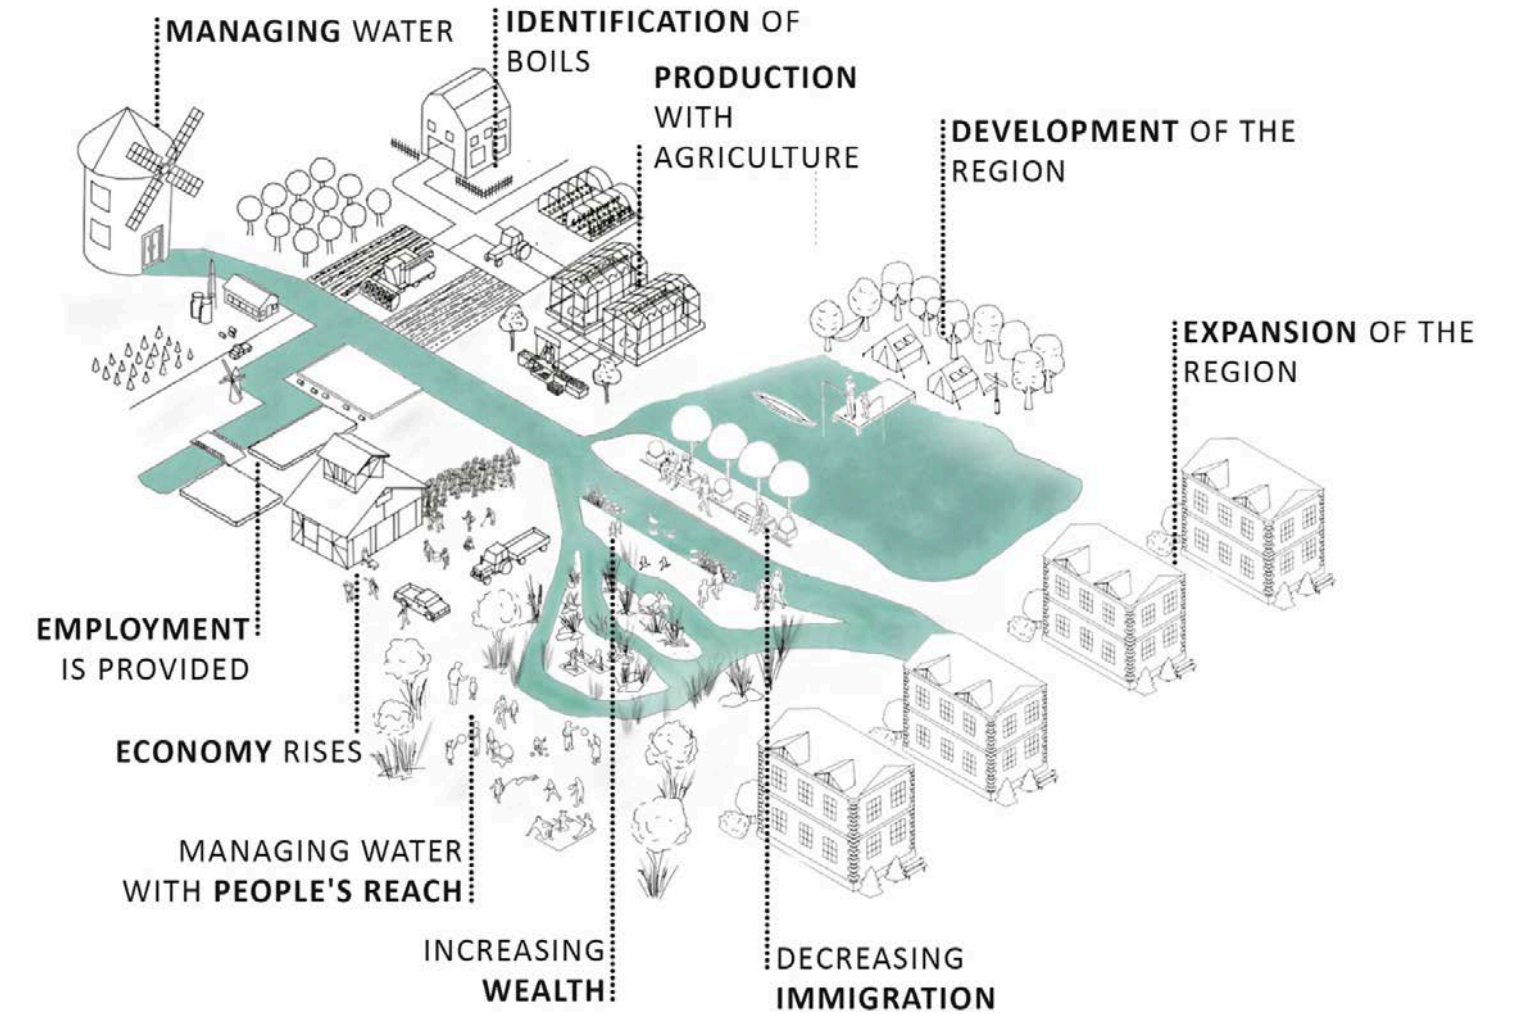

The water source in the boiling springs flows down through specific channels, aided by the topography. By creating a pond here, the water is collected, heated, and then redistributed throughout the city for different uses. Aim: Transforming space through different uses of water.

The first transformation involved the use of water in agriculture. The water was distributed to agricultural lands and its usability was enhanced by gradually heating it in specific areas. Once the water was directed to the agricultural lands, it

was also utilized around the existing water channels in the village for various functions, fostering interaction among the people. This increased the quality of life and supported the development and growth of the area with boiling water sources.

Additionally, the roads in the old settlement were widened to accommodate the needs of the people. The remaining roads were made more ecologically sustainable and functional. Moreover, a bicycle path and a trekking path around the water source were added.

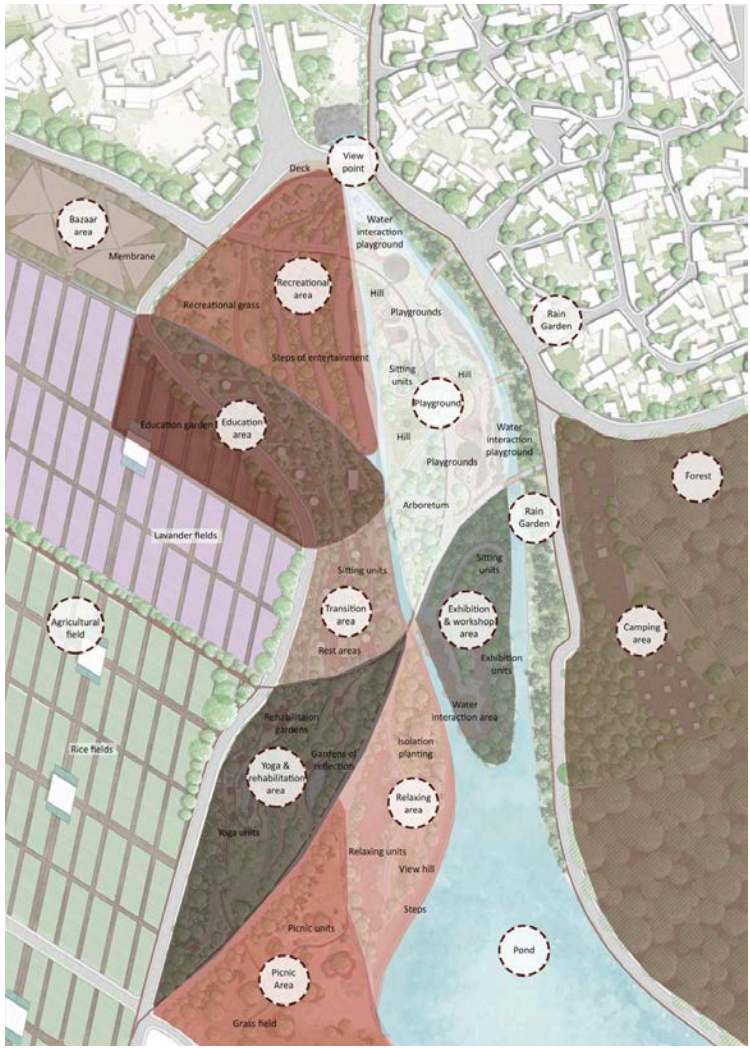

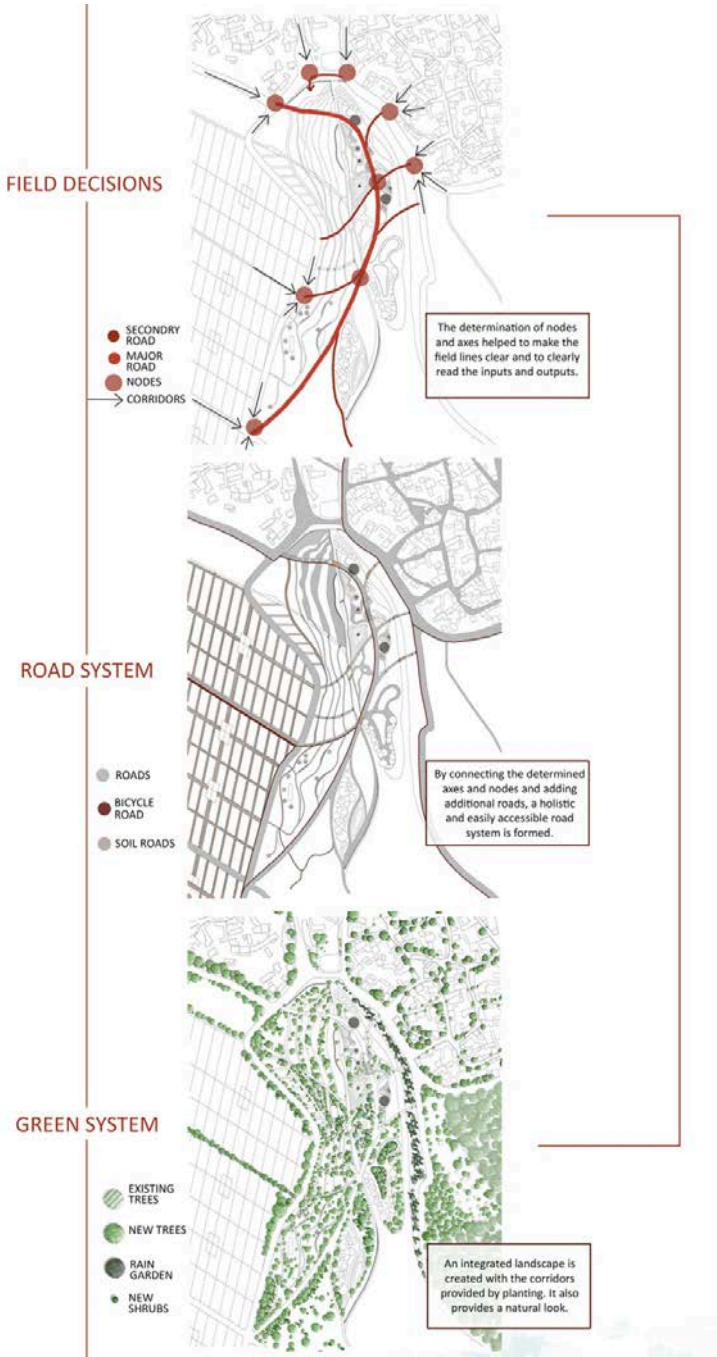

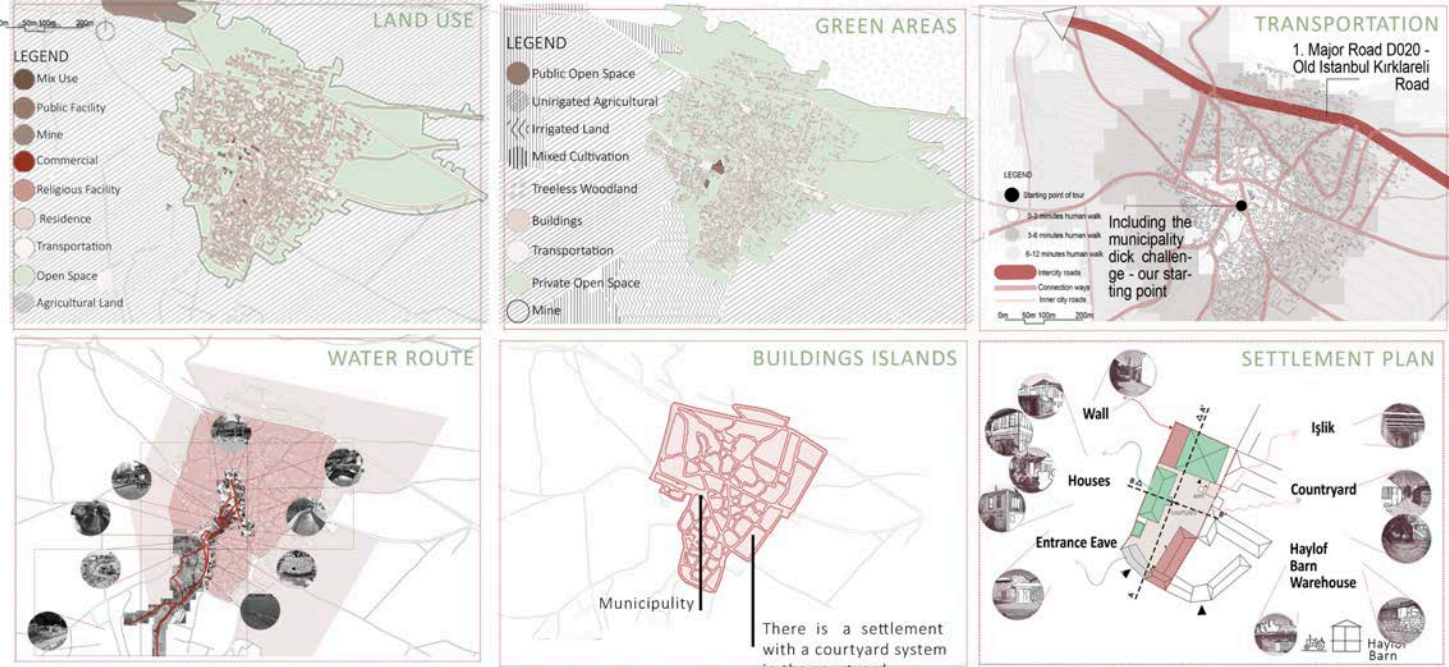

CIRCULATION OF WATER RURAL DEVELOPMENT WITH AGRICULTURE

WATERCITY DEVELOPMENT

328

329

Transformative Water

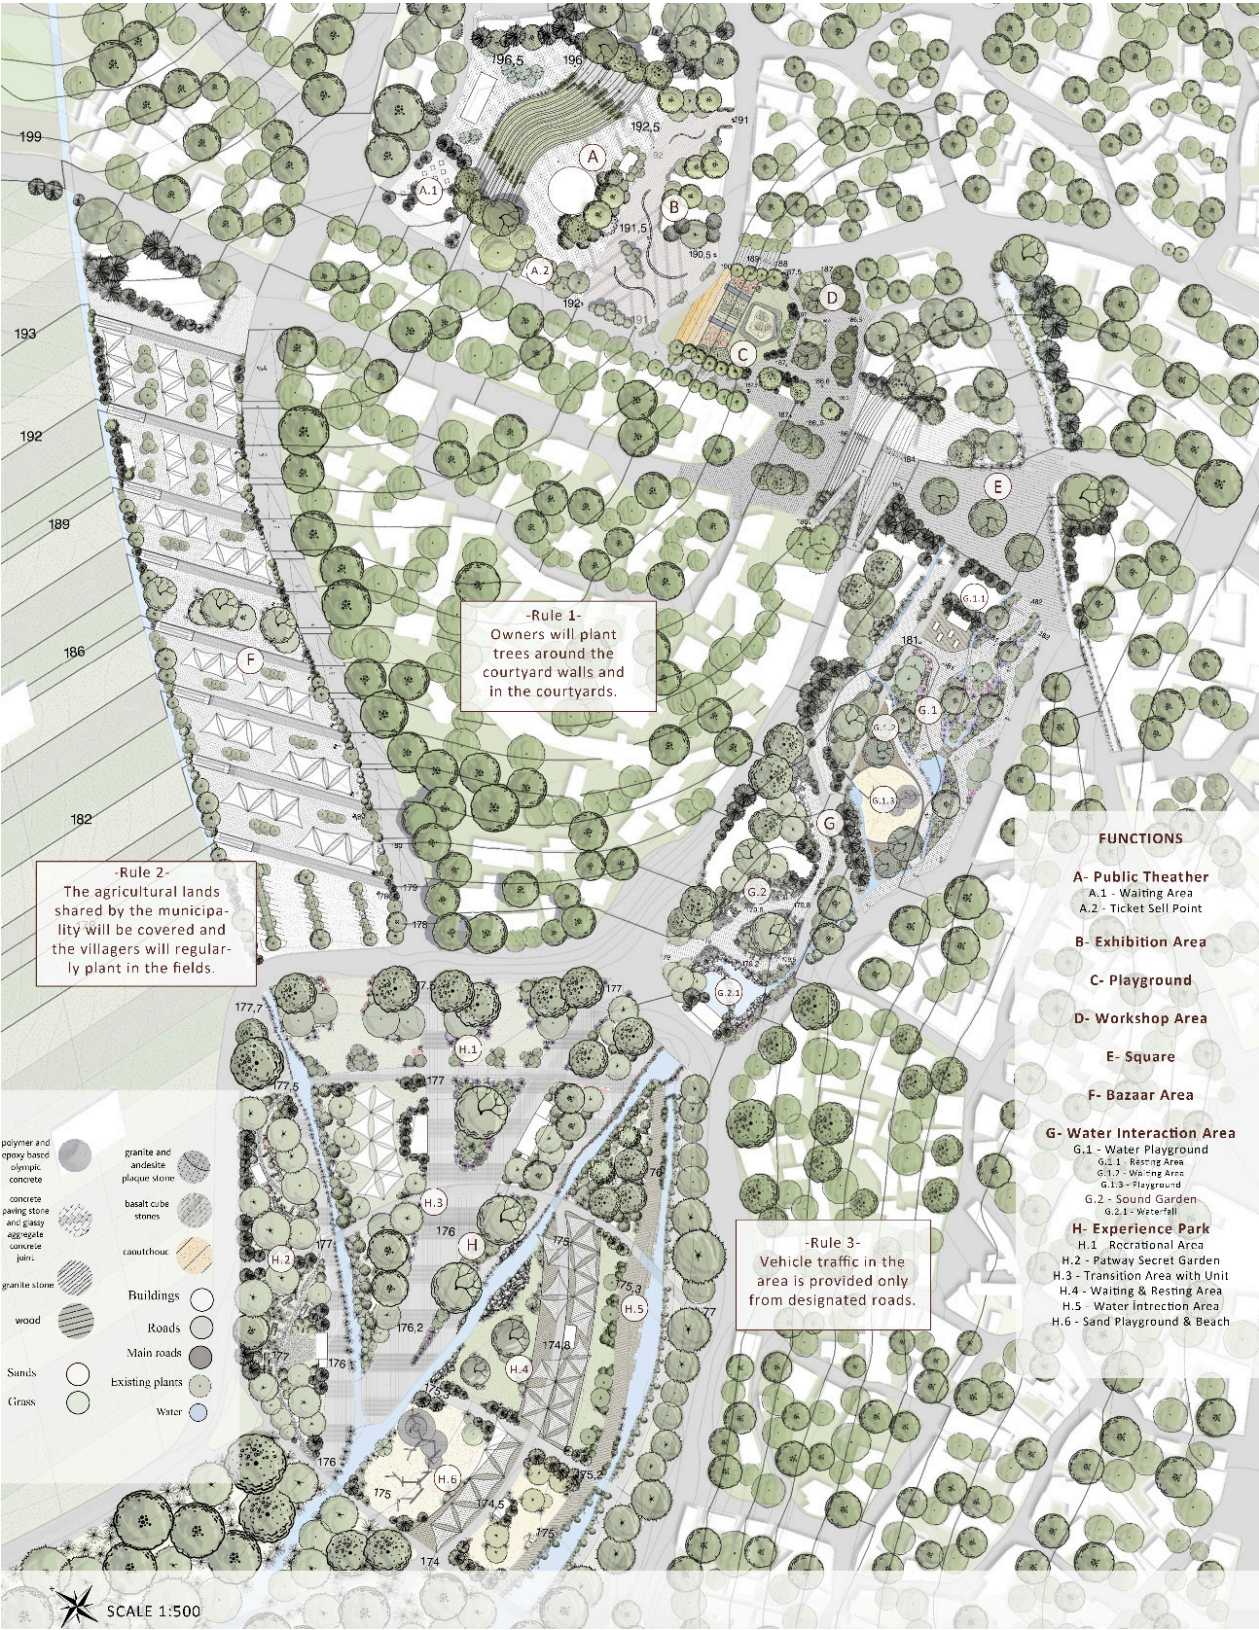

Rebeka Kayakoparan

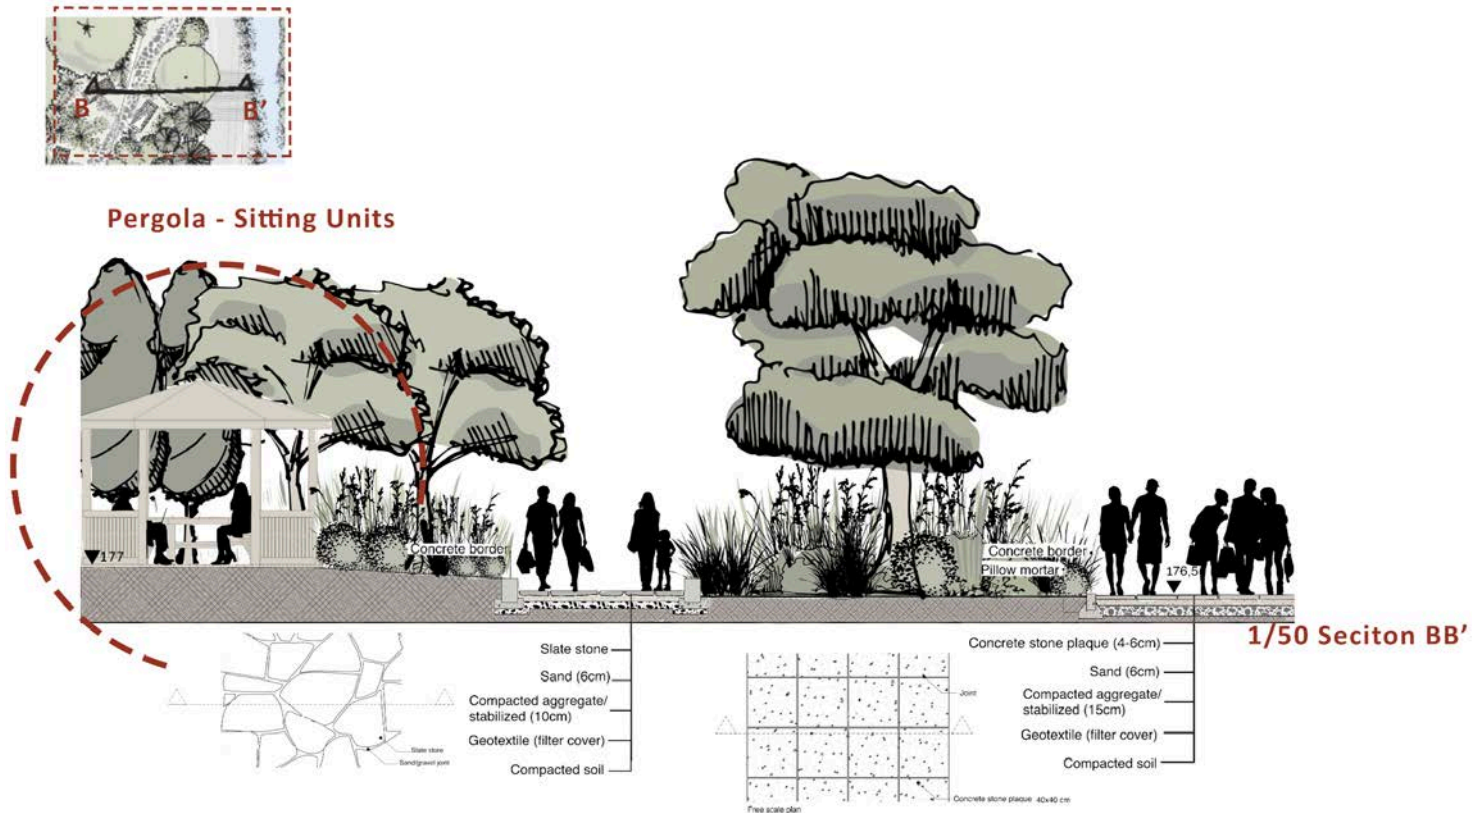

“Transformative Water” was produced within the scope of Landscape Design 3 carried out by Assist. Prof. Melih Bozkurt and Res. Assist. Fatma Sultan Yaman under the title “Virissis Verissa: post[]new landscape scenarios for Kırklareli” in the spring semester of 2021-2022.

Based on these analyses, a master plan was created, and the main focus areas were determined. The focal points of the project were covered in detail, with the primary elements identified as a theater area, children’s playground, workshop area, market area, water interaction area, and experience park. First, an open theater area was designed, intended to host acting training for women and various other performances. The design aims to create an amphitheater utilizing the natural slope of the existing topography. Additionally, there is an exhibition area where

products created in the workshop area can be displayed. One of the biggest problems in the project area is the lack of places for children and women to spend time. The aim in designing the playground is to create a compatible space without altering the existing topography. Utilizing the natural slope, various elements were created for children to engage in climbing, jumping, and sliding activities. Additionally, there is a workshop area for art activities such as marbling and sewing workshops.

Next, there is a water interaction area. This design offers a space where people of all ages can have fun using the water channels. Rainwater can also be collected here, providing various interactive experiences with water. There is a sandbox for children and a waiting/rest area for parents. Moreover, a sound garden is designed for people to enjoy and relax. The market area, a crucial spot for tourists, is designed as a space where agricultural products and locally produced materials are showcased to the public.

The aim here is to generate income and boost the economy by promoting locally produced goods. Finally, an experience area has been designed to include various functions such as water interaction points, exploration routes, picnic and festival areas, and playgrounds for children. The goal is for both local residents and tourists to experience different designs that reflect Kaynarca's identity and foster a connection with the region.

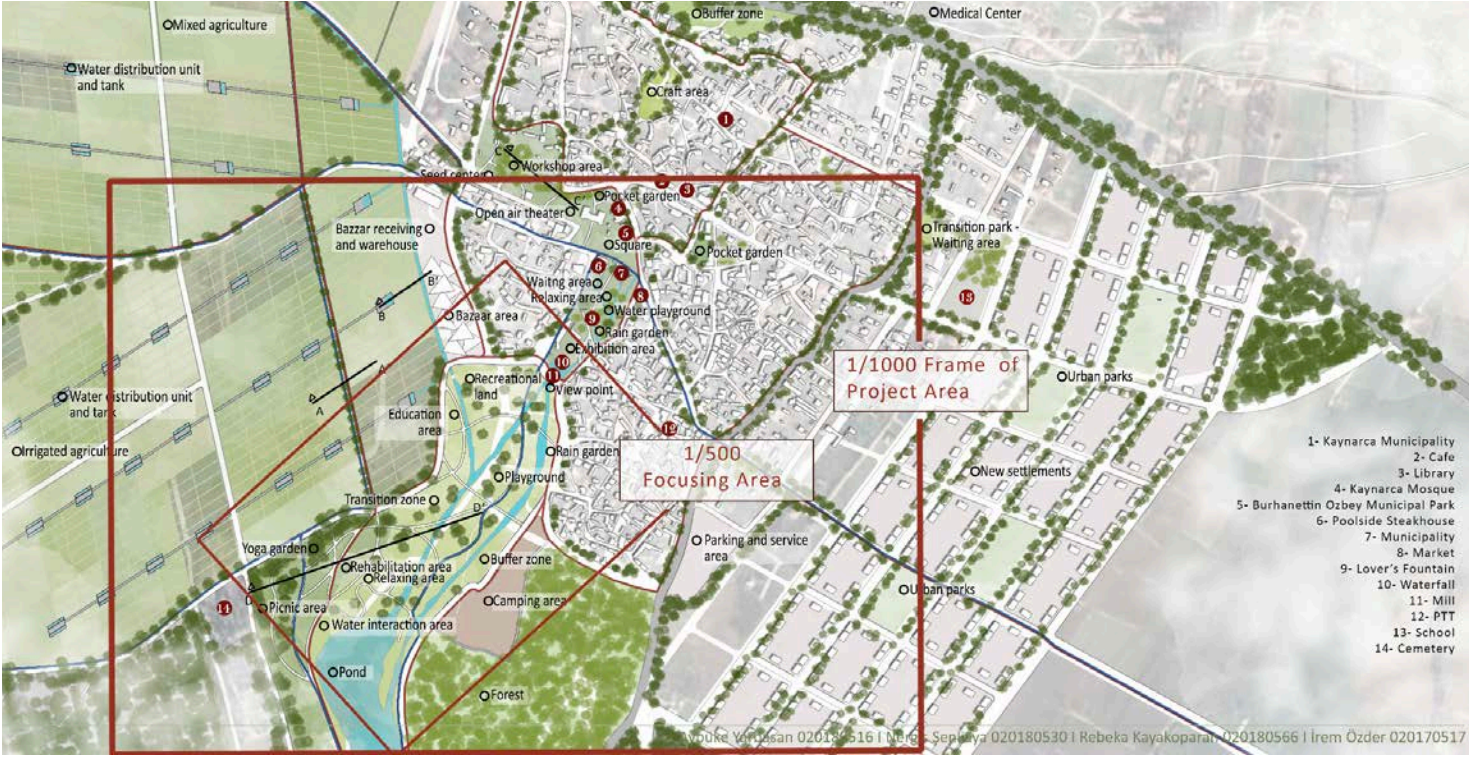

Transformative Water

Nergis Şenkaya

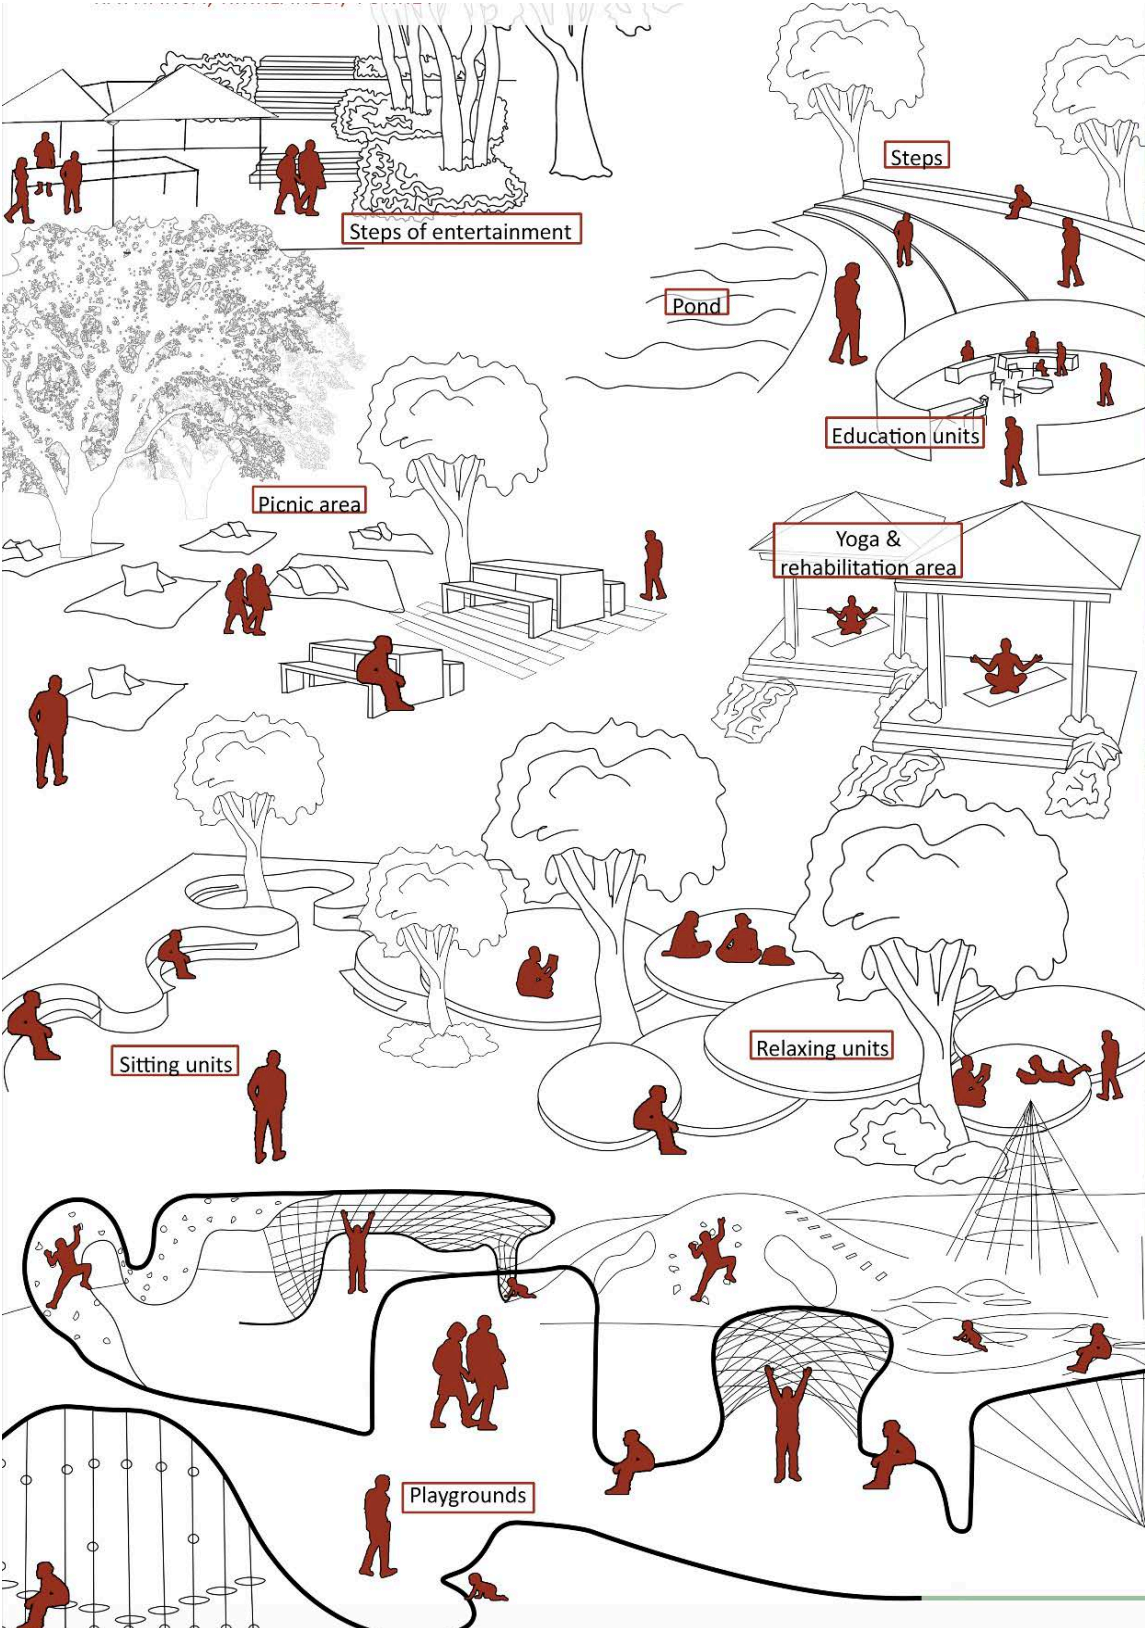

“Transformative Water” was produced within the scope of Landscape Design 3 carried out by Assoc. Prof. Melih Bozkurt and Res. Assist. Fatma Sultan Yaman under the title “Virissis Verissa: post][new landscape scenarios for Kırklareli” in the spring semester of 2021-2022.

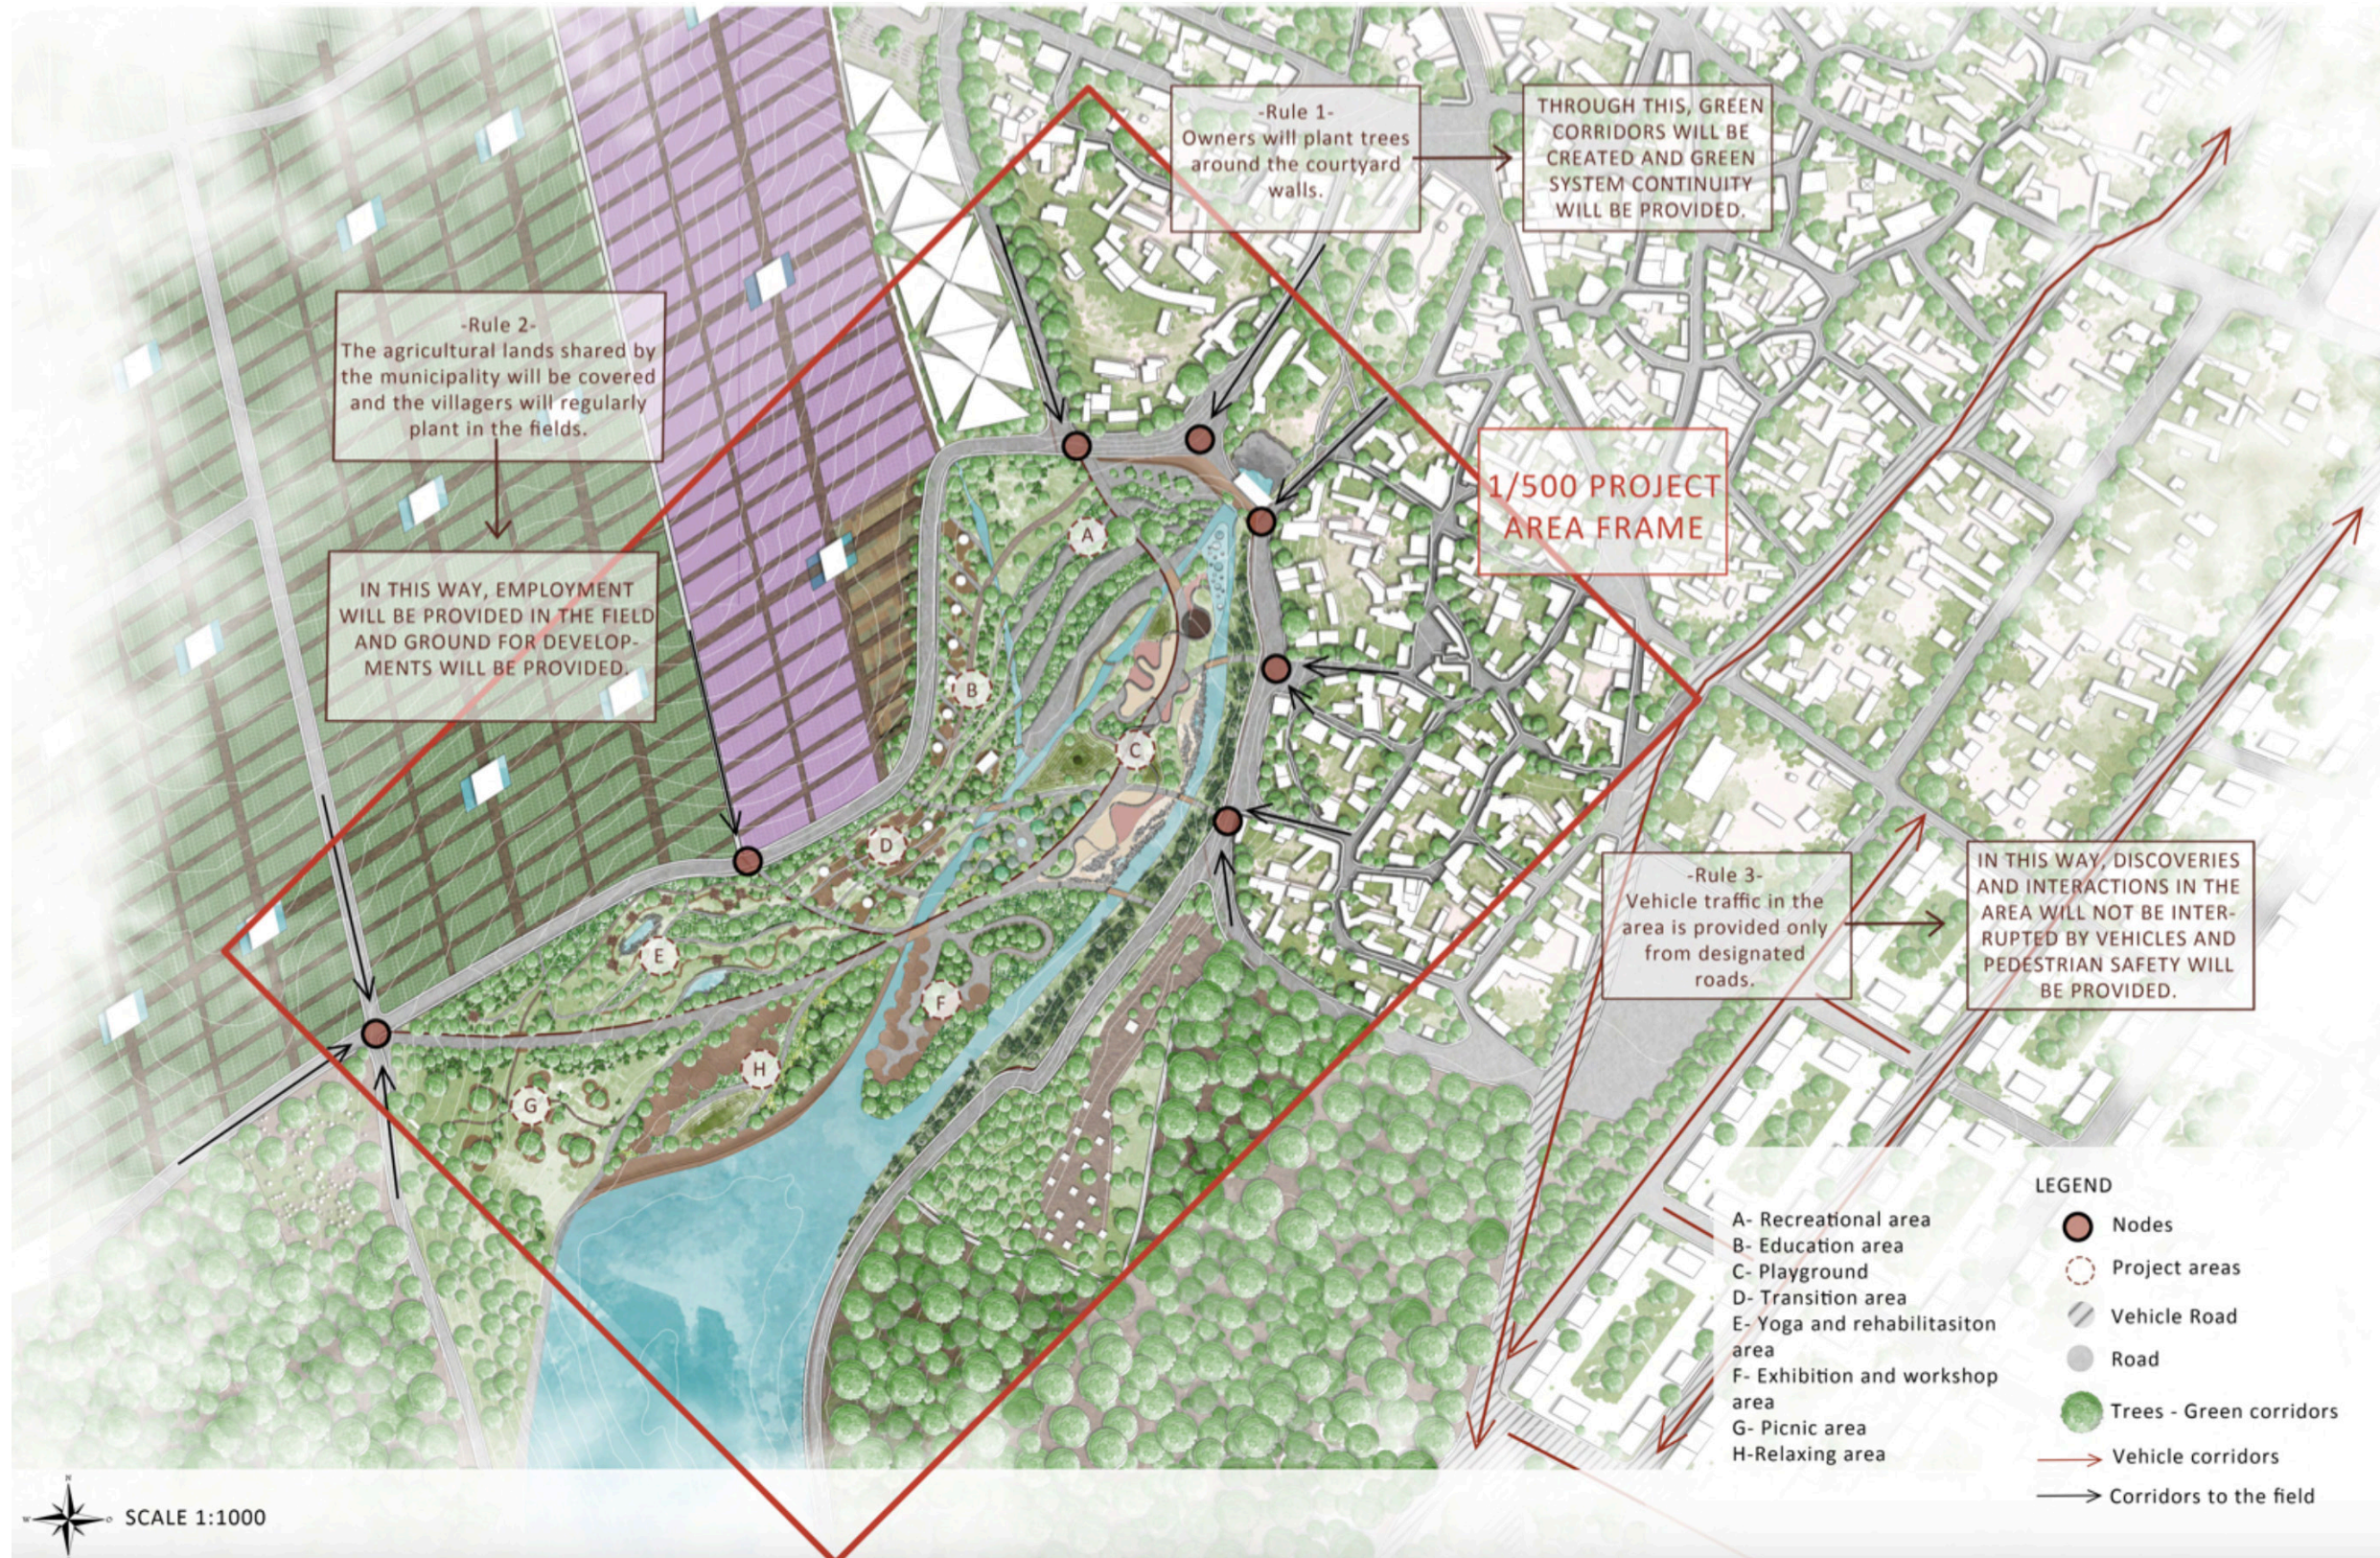

336

Our primary goal is to achieve efficiency by transforming the use of water. We aim to revitalize agricultural lands with increased yields and rejuvenate public spaces and interactions that are currently lacking. Additionally, we seek to prevent migration by gradually expanding the area along a specific axis. I established design rules, beginning with the implementation of the courtyard system. This system mandates that property owners plant trees along the courtyard walls, creating a green corridor. This ensures that connections between the newly designed area and other regions remain intact. Through these efforts, we strive to achieve harmonious and sustainable development that benefits both the local community and the broader region. I established design rules to regulate this system and its

development. First, I utilized the courtyard system to set a rule that property owners in the courtyard must plant trees along the courtyard walls. I chose Quercus as the species for these trees because it already exists in the area and would not disrupt the natural order. Following this rule, I anticipate the creation of a green corridor, ensuring that connections between the newly designed area and other regions remain intact. By using water efficiently, we can achieve optimal agricultural yields, which will, in turn, provide employment opportunities. The employment generated will pave the way for the development of new areas. Another rule is that vehicle entrances and exits are directed towards newly formed areas, ensuring pedestrian safety within the area. This approach prevents vehicle roads from interrupting area connections and situates spaces designed for people's tranquility away from vehicle noise.

337

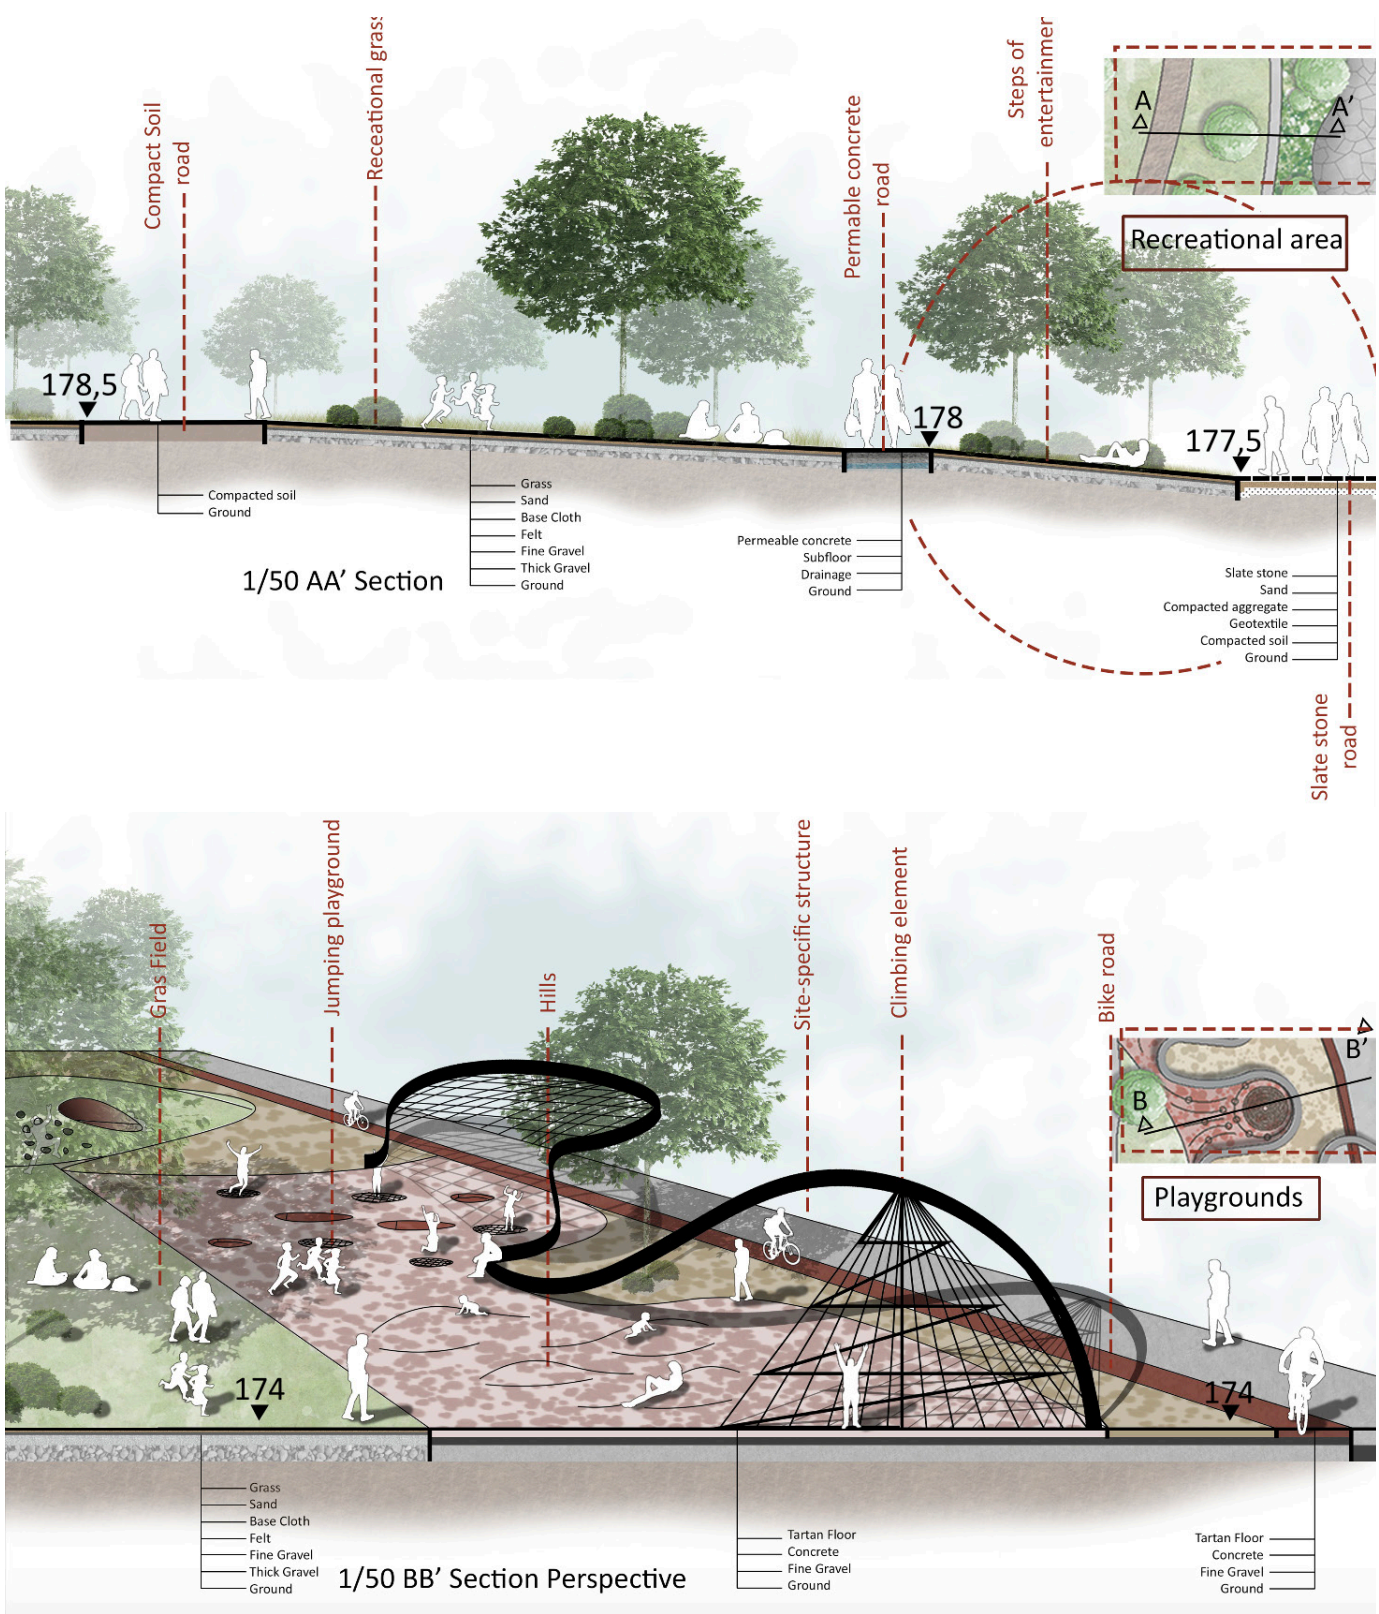

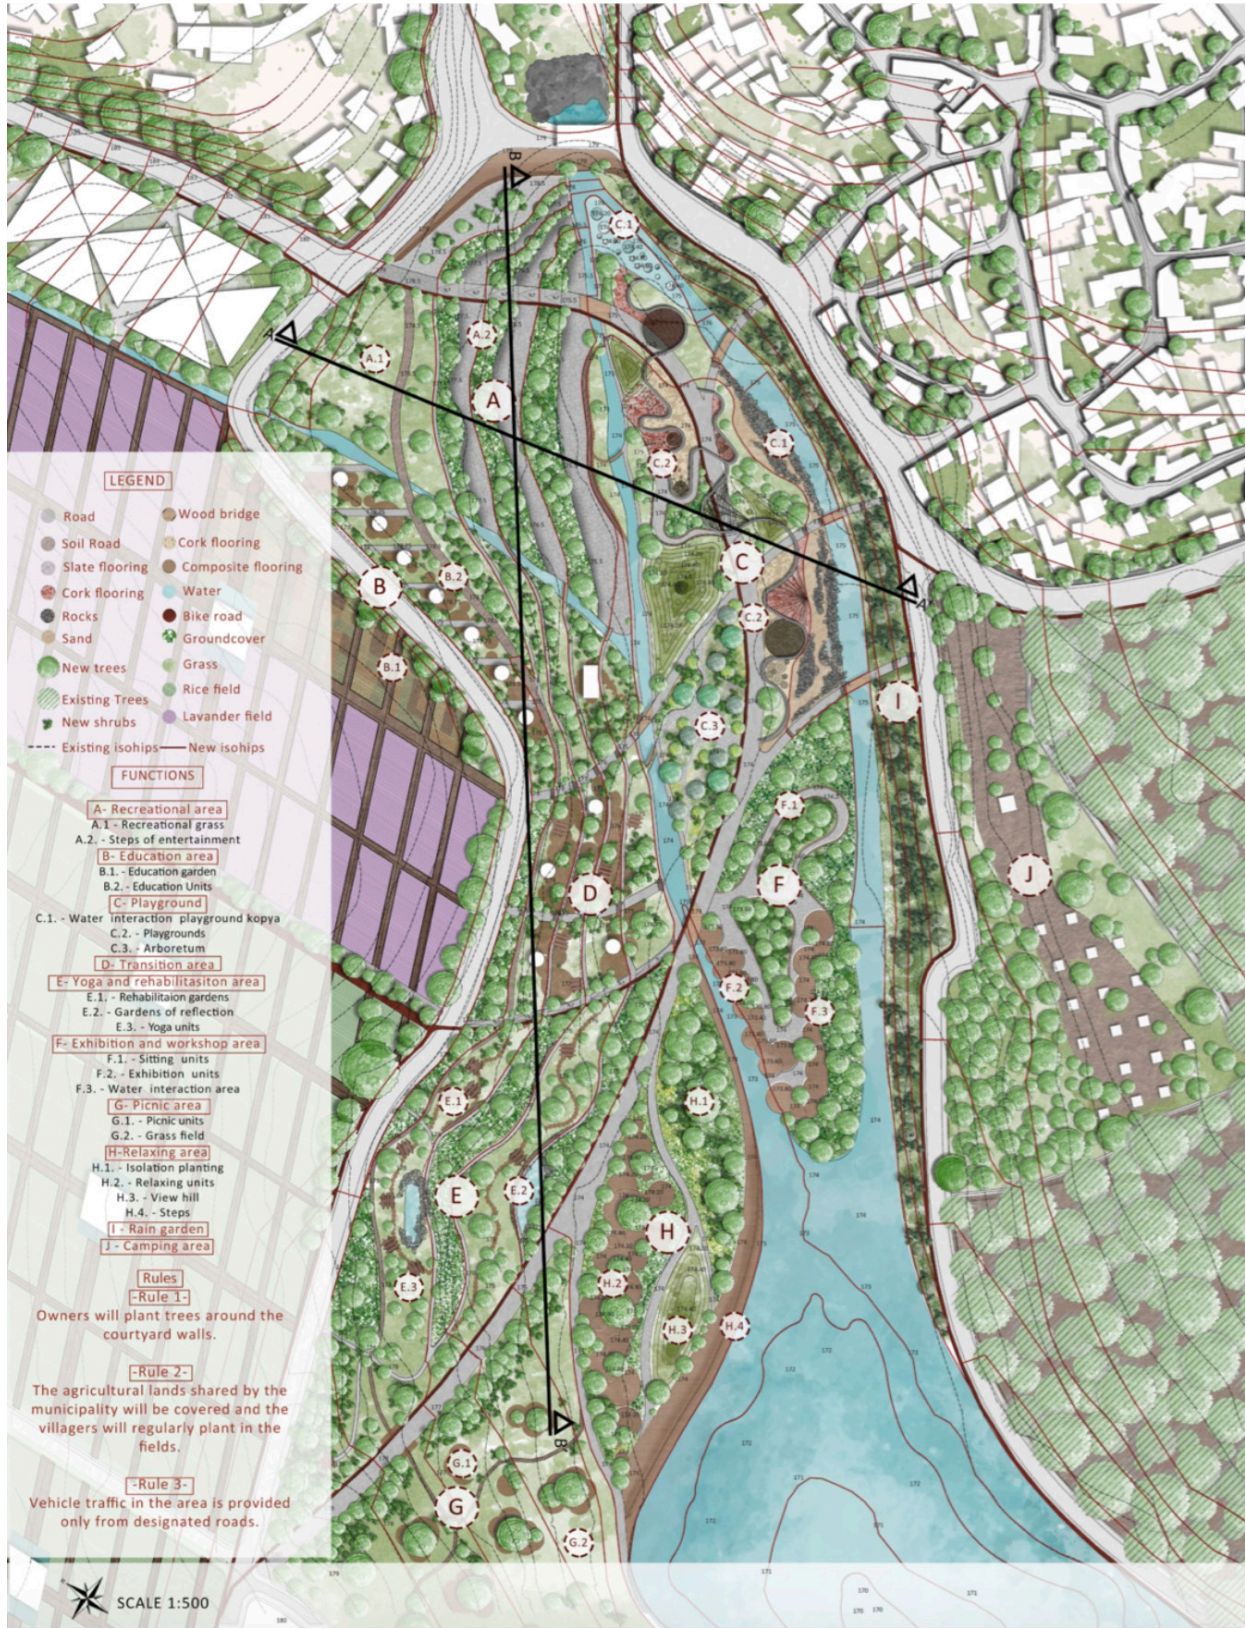

After establishing these rules, I analyzed the axes and nodes of the area to be designed and determined the functions. I identified the nodes based on the existing lines of the field and emerging features within it. Consequently, I determined a main axis that traverses the entire area from the main focus, and an axis that connects to this primary route. I also added a secondary dirt path and bike paths to accompany these axes, allowing for a complete tour of the area and enhancing the user experience.

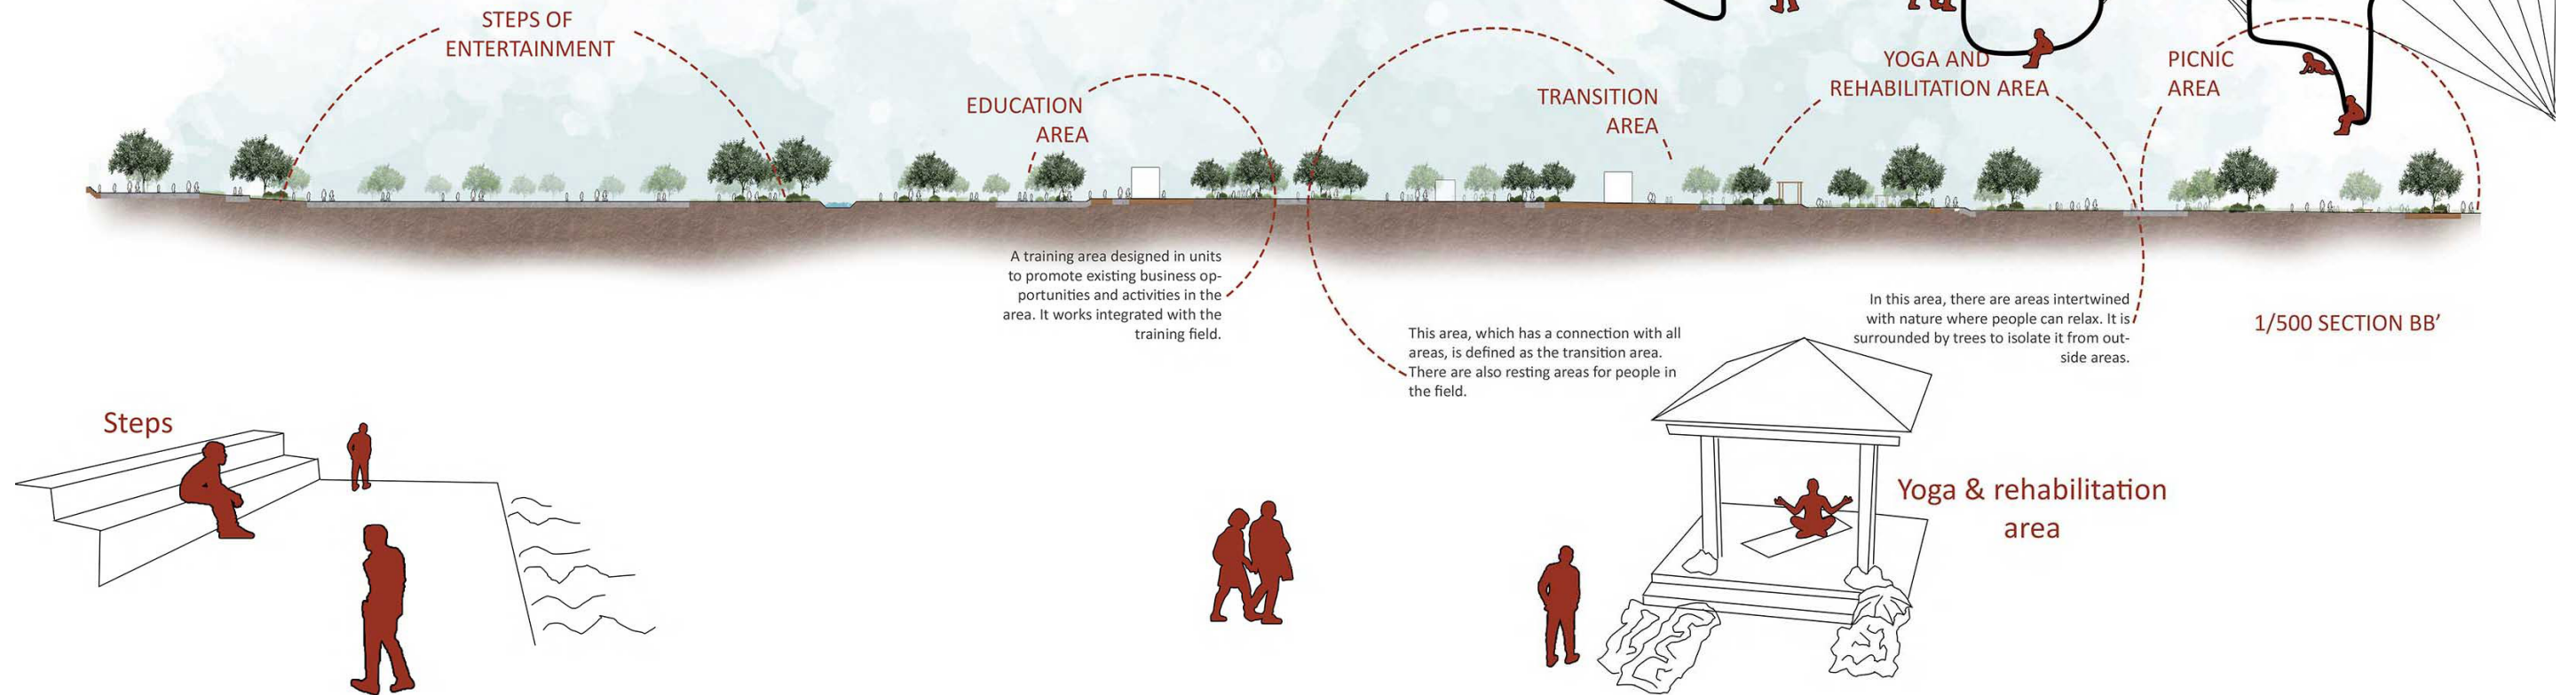

Regarding the green cover, an integrated landscape emerged from the established rules, connecting the new area harmoniously. The functions within the area consist of a natural park concept that works cohesively to address the lack of public spaces in the region.

The existing water flow in the area is utilized as needed. Surrounding these water features, there are various zones with specific functions, including an entertainment area, playgrounds, an education area, a listening area, a yoga and rehabilitation area, a picnic area, an interaction area, a camping area, and a transition area. These spaces not only serve the residents but also cater to the broader community, providing diverse recreational and educational opportunities for everyone.

The area consists of an amusement zone, including an amusement lawn and amusement steps. Festivals and events will be celebrated here, and in the absence of events, women can contribute to their household economy by selling products at stalls set up on the steps. Additionally, visitors can sit on the steps and enjoy a view of the entire park, creating a pleasant atmosphere.

Through these interactions, arrangements, and designs, a holistic atmosphere will be created. The area will transform into an inviting space, appealing to people of all ages and fostering community engagement and enjoyment.

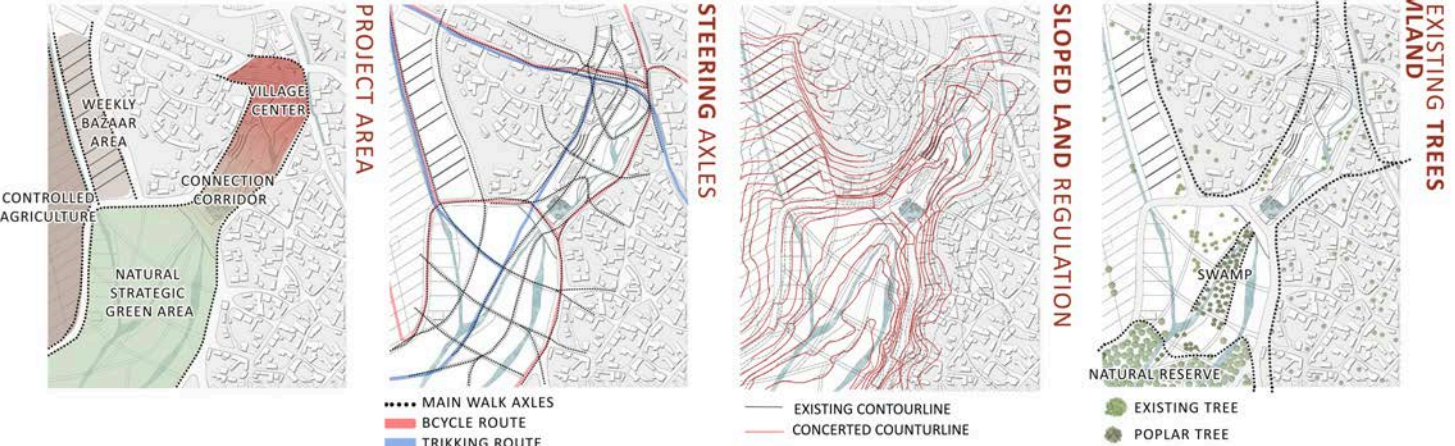

Transformative Water

Aybüke Yarbasan

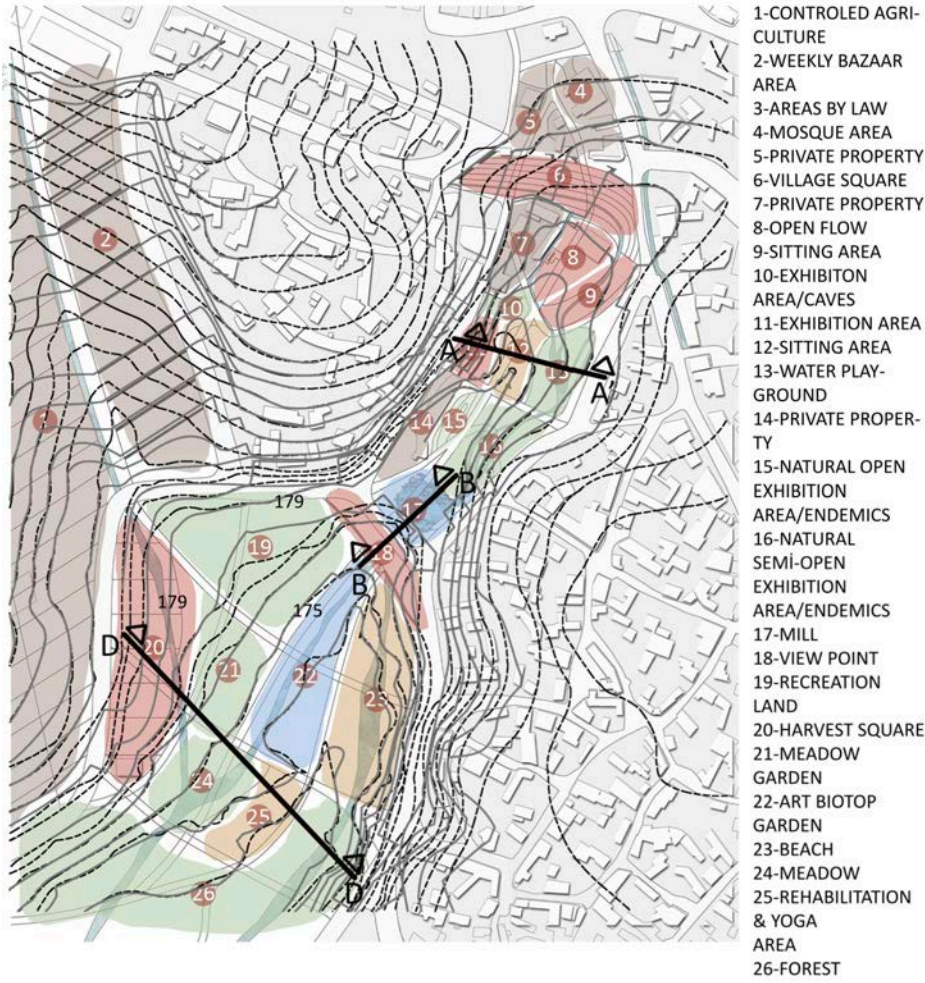

"Transformative Water" was produced within the scope of Landscape Design 3 carried out by Assoc. Prof. Melih Bozkurt and Res. Assist. Fatma Sultan Yaman under the title "Virissis Verissa: post][new landscape scenarios for Kırklareli" in the spring semester of 2021-2022.

PRELIMINARY PLANS FOR 1:500 MASTER PLAN

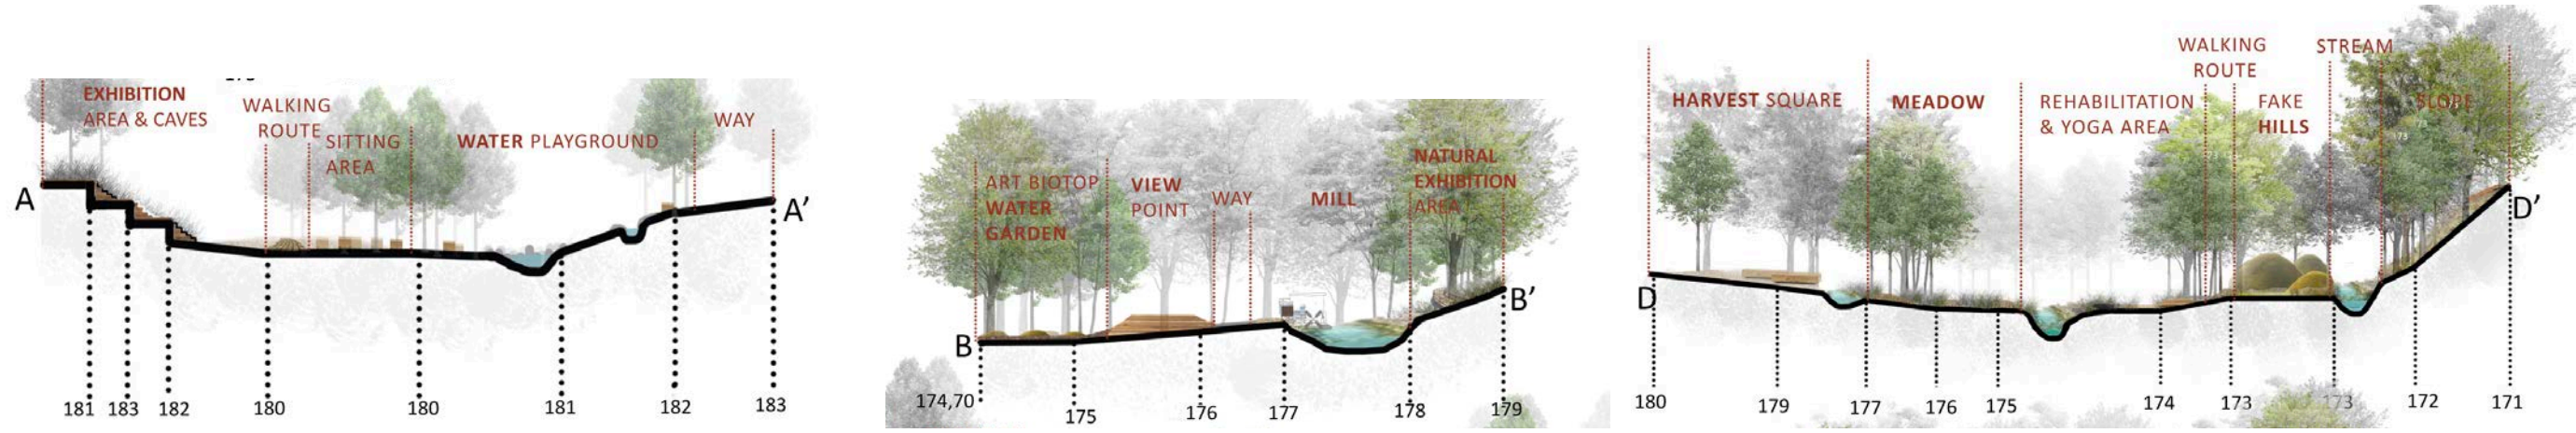

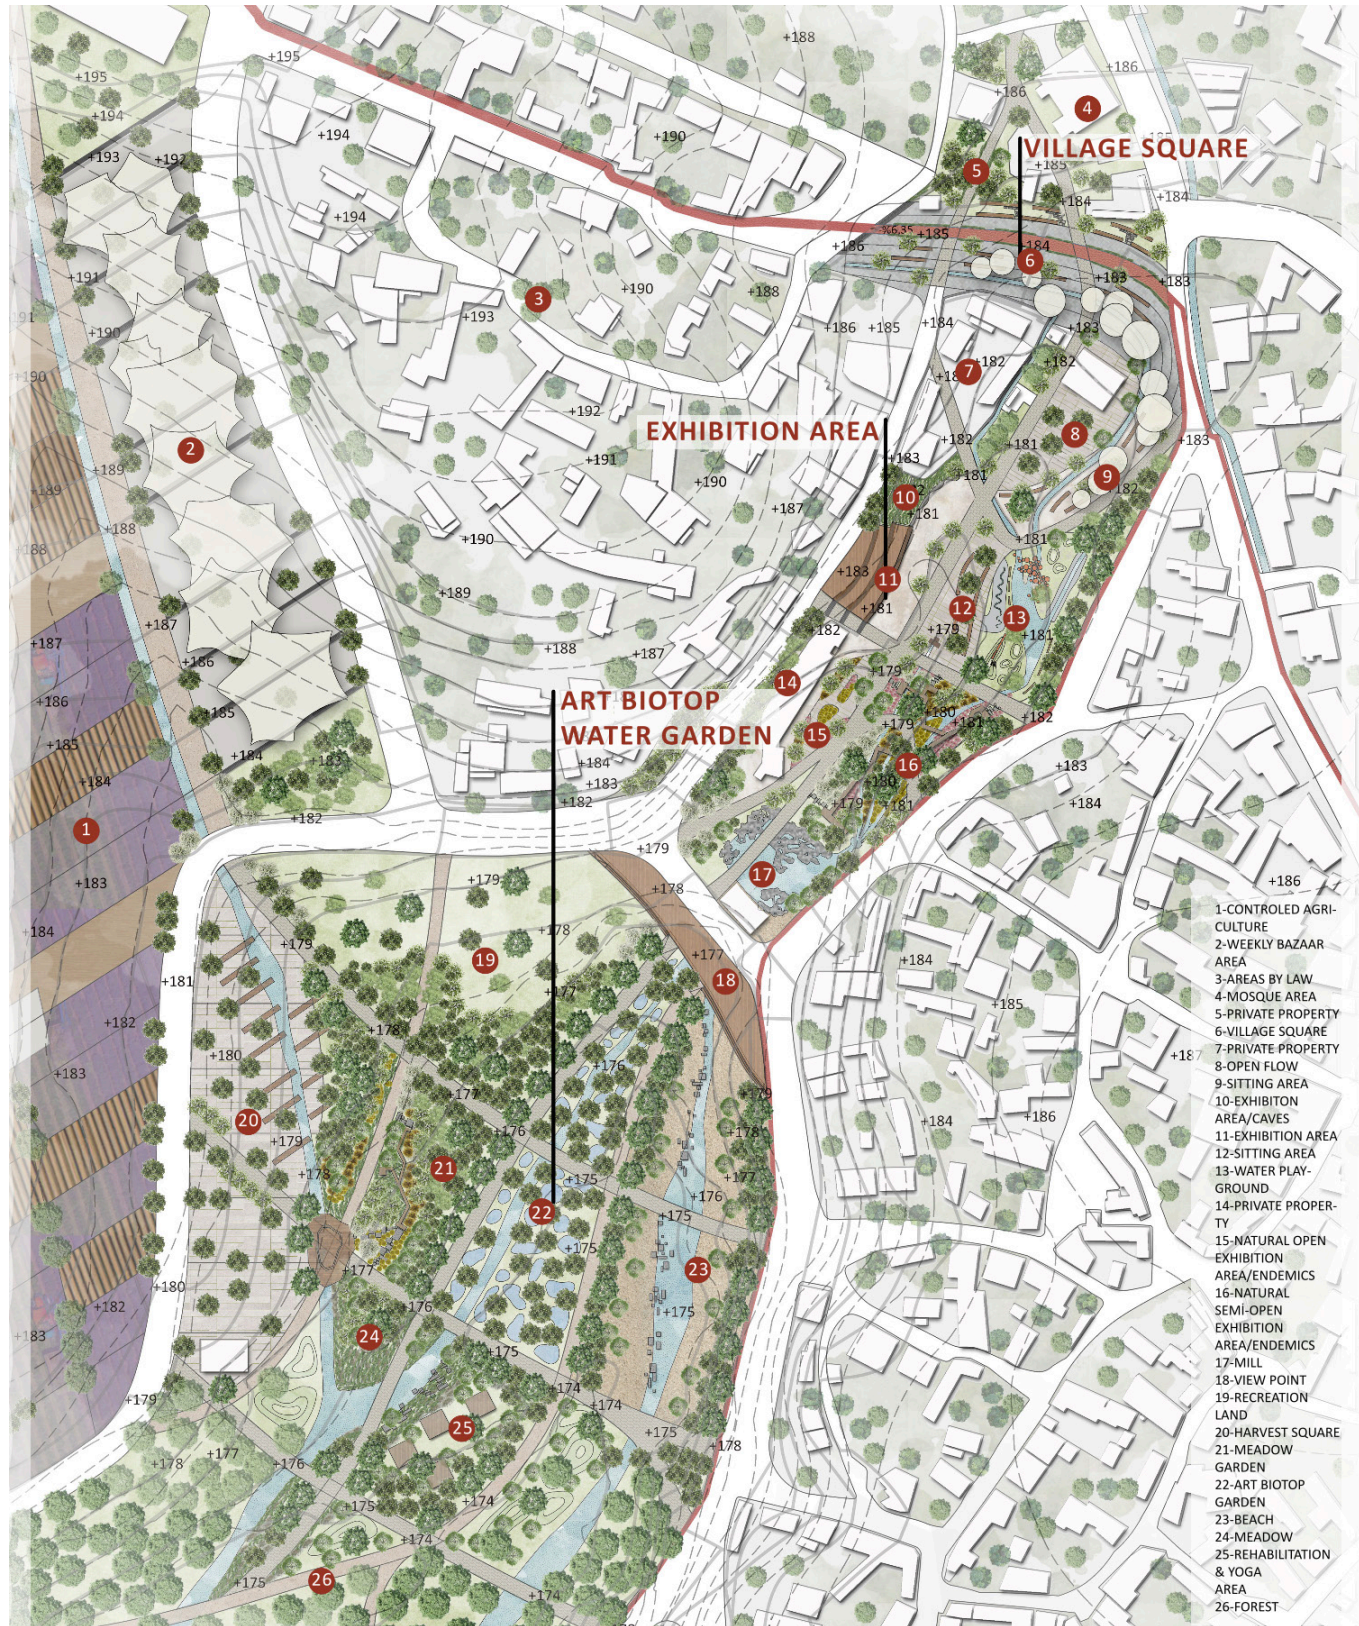

The solutions derived from these efforts can be summarized as creating an accessible landscape for people, ensuring access to water, engaging the community with workshops and activities, teaching local culture, producing organic products and creating sales points, generating business opportunities, and preserving agricultural heritage. I analyzed Kaynarca's botanical infrastructure by categorizing it into three groups: endemic species, monumental trees, and plants historically used and currently still used in agriculture. Endemic species continue to thrive in hot springs and open green areas, and the density of monumental trees remains quite high. However, many agricultural products are no longer cultivated due to the decline in farming activities.

PROGRAMMING

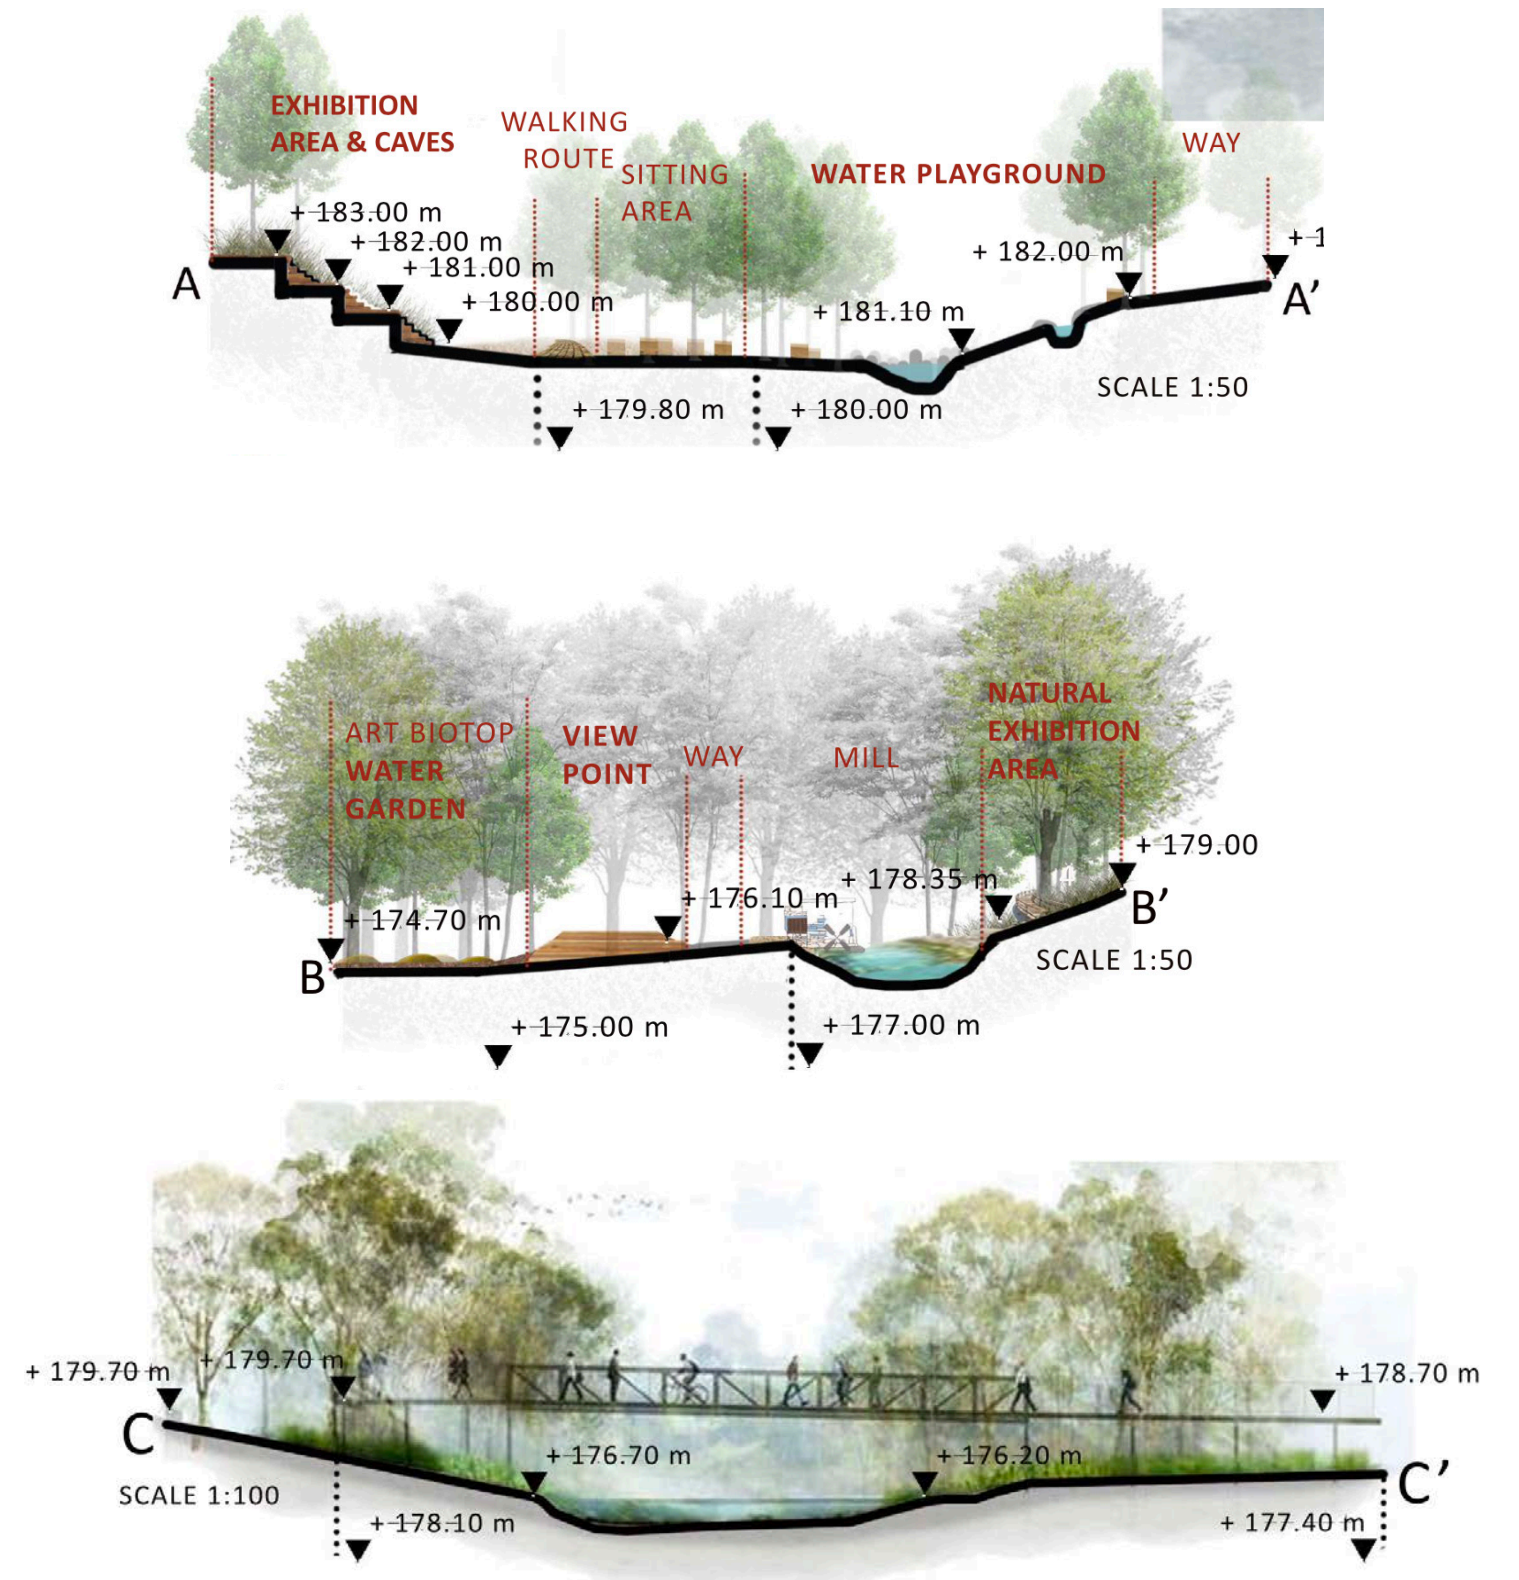

UNDERSTANDING TOPOGRAPHY

2021-2022 Spring

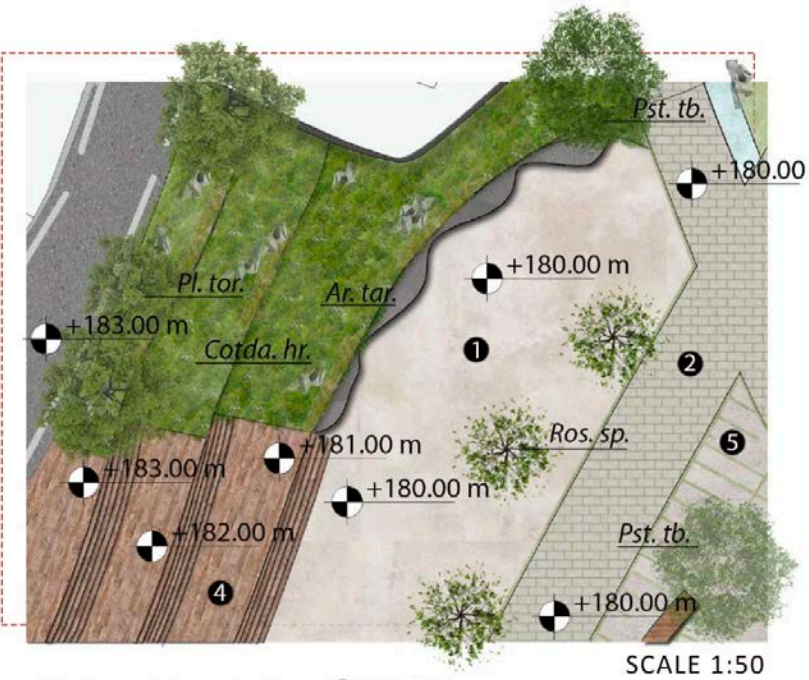

LD III / Virissis Verissa: post][new landscape scenarios for Kırklareli

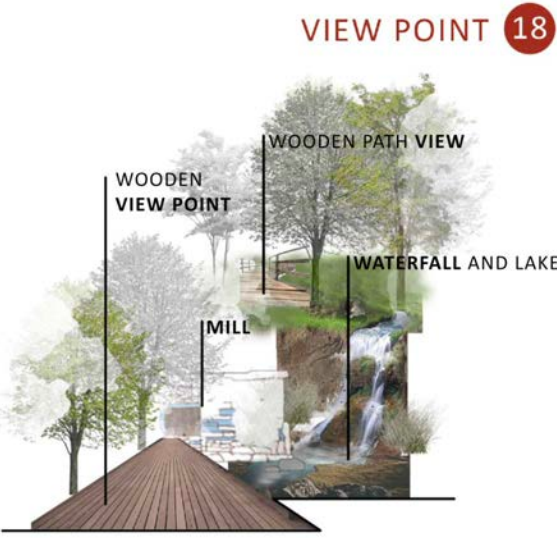

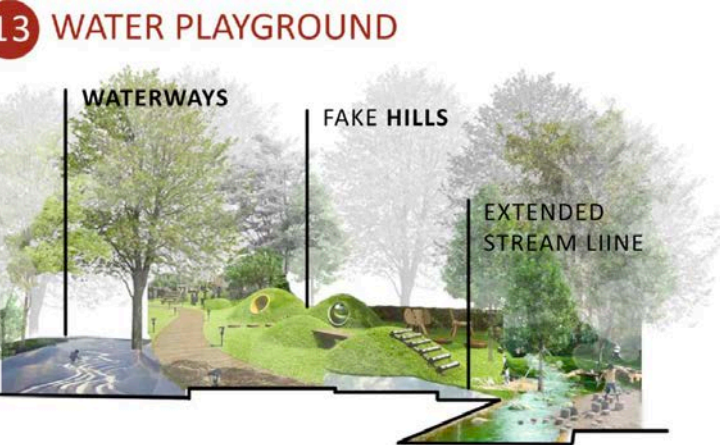

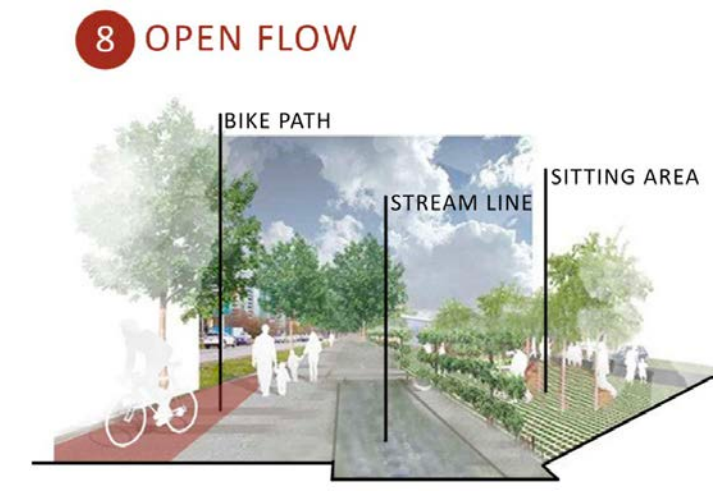

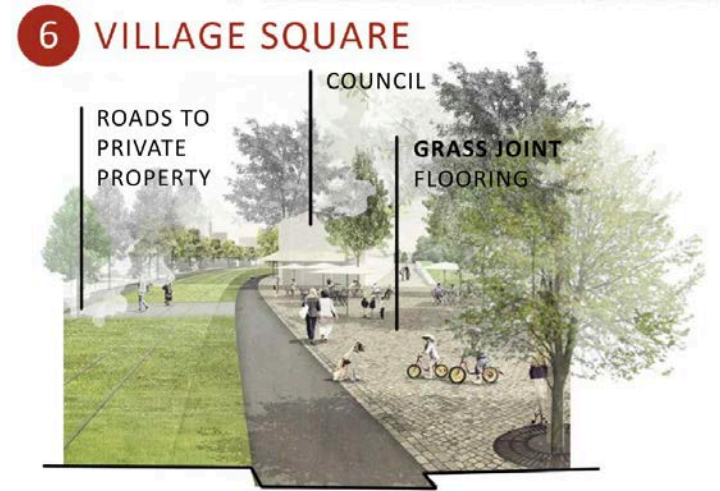

I planned to revitalize the area by organizing festivals and events throughout the year in Kaynarca. Some of these include the Winter Festival, Sugar Beet Cultivation Festival, Strawberry Harvest, Water Festival, Rice Cultivation Festival, Bike Festival, Sunflower Festival, and Orienteering events. This landscaping project is developed based on the needs of the people, providing a framework for implementing these festivals and events. I aimed to design more accessible social activity areas by dividing them into various sub-functions. These include a weekly bazaar area, controlled agriculture zones, a new village square, open flow areas, an exhibition and event area, a water playground, sitting areas, natural species exhibition areas, a wooden deck with

a mill view, a meadow garden, a beach, a rehabilitation and yoga area, the Art Biotop water garden, and Harvest Square. In the village square, I used shading elements to create a landmark feature that emphasizes the village center and establishes it as a key node. The Art Biotop water garden is designed to enhance the natural topography by transforming a previously swampy area into a series of small pools that allow water absorption, creating natural functions within the landscape. Additionally, by developing the trekking route in the area, I ensured it passes through the village. I also created a bicycle route that allows for a complete tour of the village, including natural landscapes and fields, with rental points at specific locations.

My aim was to establish natural green corridors in the village through specific rules. One such rule mandates that homeowners with a garden of ten square meters must plant two trees per ten square meters. This initiative is intended to strengthen the village's green infrastructure. Among the proposed landscaping works, I also suggested new road types that are more sustainable and ecologically beneficial. By incorporating one or two bioswales on the streets, I aimed to collect water and create green corridors. For planting, I focused on using species native to the Kirklareli region, including monumental trees and endemic plants. Trees were strategically used for sound shielding, security, wind shielding, and most importantly, providing shade. In the endemic gardens, I created wooden platform routes to enhance the experience of visiting these natural species gardens. For the village square, I used basalt cube stone, while the main connection roads feature basalt cube stone with green joints. The bike paths are covered with tartar ground, seating areas with granite plaque stone with green joints, and other areas with a combination of wood, sand, and slate with grass joints.

Palimpsest Kaynarca

R. Ezgi Beyen

“Palimpsest Kaynarca” was produced within the scope of Landscape Design 3 carried out by Assoc. Prof. Ebru Erbaş Gürler and Res. Assist. Gizem Aluçlu under the title “Virissis Verissa: post”[new landscape scenarios for Kırklareli] in the spring semester of 2021-2022.

Kaynarca is a town in Kırklareli, located right in the middle of the transportation network between Istanbul and the Thrace region. Kaynarca, named after its boiling spring waters, is famous for its waterfall and stream, attracting tourists during certain periods. In addition to its natural attractions, the town has ancient caves and churches that are thousands of years old. However, it is primarily known for its stream, and its historical sites remain largely unrecognized. Despite attracting many tourists, the town experiences emigration, and agricultural activities have declined. Considering these factors, it has been concluded that Kaynarca faces social and

economic collapse, and the importance of preserving nature has been overlooked. Efforts to improve Kaynarca’s social, economic, and natural cycles involve a program network integrating these three main aspects. The programs are designed to spread throughout the town, aiming to disperse the crowds around the creek and encourage visitors to explore the entire town and interact with locals. In line with these objectives, various places such as wetlands, squares, inner courtyards, small plazas within the settlement, a market axis, an open kitchen, a soil school, a festival axis, and a gastronomy axis were identified and designed.

PALIMPSEST FEATURE OF KAYNARCA

352

FEATURE SENARIO: URBAN DYSTOPIA

353

Kaynarca is a village in Kırklareli, situated between Istanbul and the city center, and close to the borders of the Thrace region, offering significant opportunities. Positioned at the junction of multiple routes, it is highly accessible. The village takes its name from its springs, which attract many visitors to see the springs, waterfall, and river. While people enjoy the river, they are often unaware of the caves and church dating back to ancient times, which contribute to the palimpsest structure of the area.

While attracting many visitors, Kaynarca simultaneously experiences significant emigration of young people due to a lack of job opportunities.

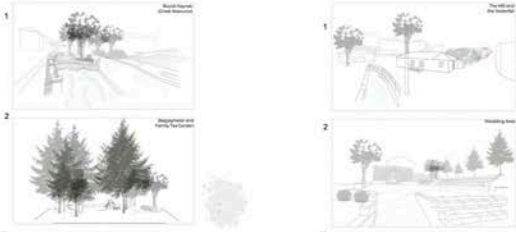

Social life is also quite inactive outside of the summer and spring seasons. The condition of the natural environment in the village has deteriorated. Decreased water levels and increased pollution have diminished agricultural practices compared to the past.

GOAL1: SOCIAL IMPROVEMENT

Problem: The countryside is not included in social life, social life gathered in one spot.

Social life in past and today

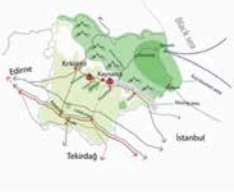

Existing meeting points

Strategy pack 1: Social pack

GOAL2: ECONOMIC IMPROVEMENT

Problem: In-village by using tourism potential revitalizing the economy

Strategy Pack2:

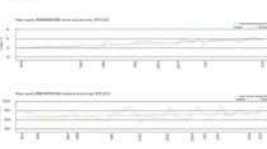

Potential Areas

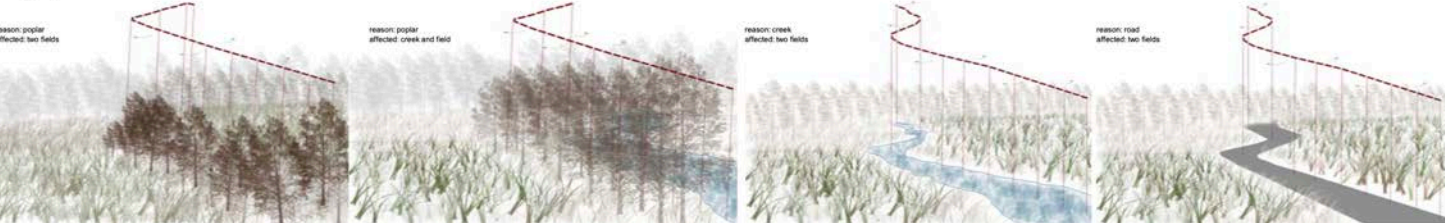

Programs

GOAL3: ECOLOGIC IMPROVEMENT

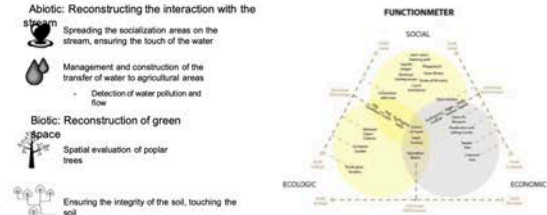

Problem: Decoupling between the ecological layer and the space

Analysis

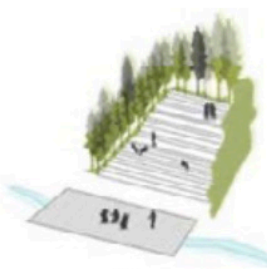

Decoupling of natural elements

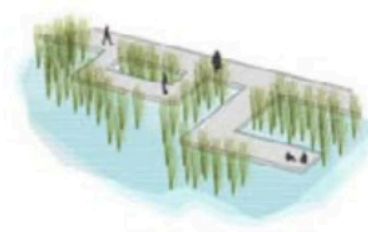

Strategy Pack3:

To revitalize the area, a three-layered program has been created, focusing on social, economic, and environmental aspects. These layers overlap in some areas. The programs include an open kitchen, open library, square, open learning areas, playground, soil school, resting area, viewing area, mini squares, courtyards, and bazaar-festival-gastronomy festivals. The goal is to distribute these programs throughout Kaynarca to help people experience the real essence of the town, beyond just

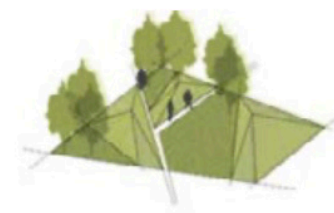

the river, and to bring together rural and urban residents. Special attention was given to the wetland, square, celebration area, and open library, which are located in close proximity to each other. Since these areas are adjacent, a seamless flow of space was created between them to guide people through the area. Each space was designed with a consistent style, using wavy forms to ensure coherence throughout the entire area.

Rural - Urban Relationship

Material & Texture

Ergene Water System

Thracian Vineyard Route

Kaynarca- Industrial Relationship

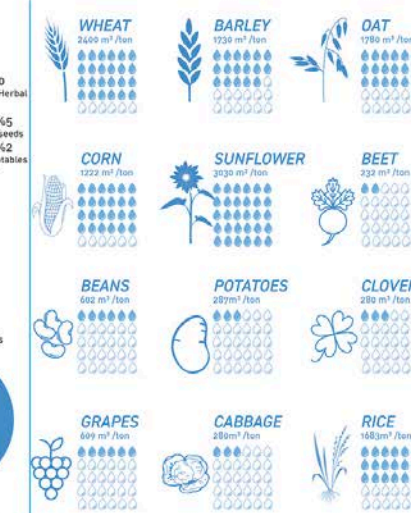

Water Footprint

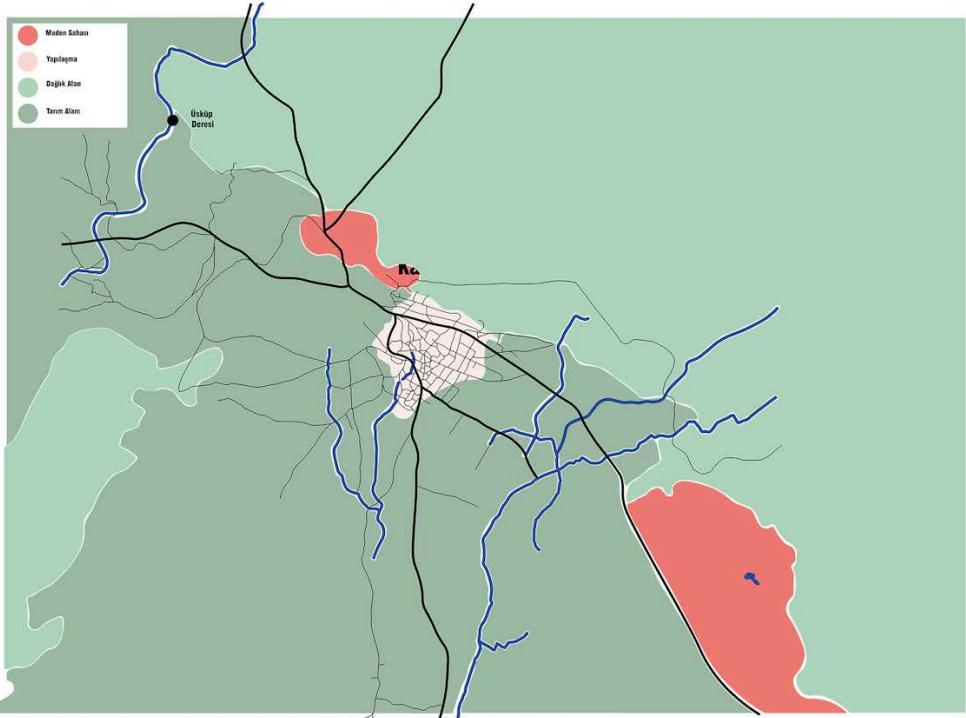

The agricultural sector accounts for 73% of Turkey's agricultural footprint.

Agriculture in Kırklareli - Kaynarca

Vegetation Map

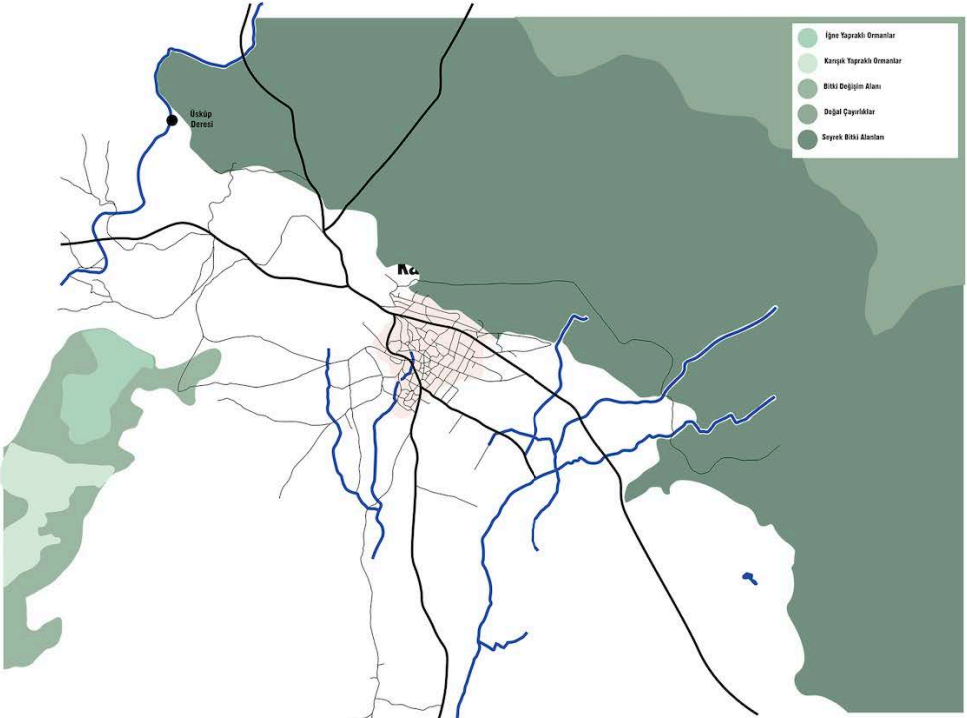

Plant Exchange Area
It includes areas where shrubby herbaceous plants are scattered together with trees and natural forest development areas. Forest regeneration or cutting areas are included.

Sparse Plant Area
They are steppe, tundra and infertile soil areas. They have scattered, woody and semi-woody vegetation at high altitudes.

- Unstable stone, rock cover on steep slopes where the vegetation rate on the surface is between 10%-50%
- Sub-desert steppes
- Limestone fields or "lapie" fields
- Bare soil in military training grounds
- Karst areas

Forest Map

Coniferous Forests
The vegetation composition consists mainly of trees. Includes maquis and shrubs under trees with predominantly coniferous species (more than 75%).

- Coniferous forests that do not remain green all year (hybrid pine)
- Forests of young conifers
- Woody forests dominated by *Juniperus oxycedrus/phoenica* species
- Woodland areas with conifers
- Christmas pine plantations
- Bare spots and meadows in the forest area

Mixed Leaf Forests
The vegetation composition consists mainly of trees. Includes shrubs and shrubs under trees where neither coniferous or broadleaf species predominate.

- Mixed forest, wooded dunes
- Bare spots and meadows in the forest area
- Scattered heath

Agricultural Map

Irrigated Arable Land
Cereals, legumes, feed products, rooted (subsoil) crop fields and fallow fields. Flowers, fruit trees and vegetables (whether grown outdoors or in a plastic/glass greenhouse) are included.

- Plants grown in flooded fields (paddy etc.)
- Semi-permanent crops
- Temporarily fallow fields
- Sugar cane

Continuously irrigated areas
It includes irrigated crops that have a permanent infrastructure (irrigation channels, drainage network and additional irrigation facilities) and are constantly or periodically irrigated. Most of these crops cannot be cultivated without a water supply. Irrigated agricultural lands that are irrigated sporadically are not included.

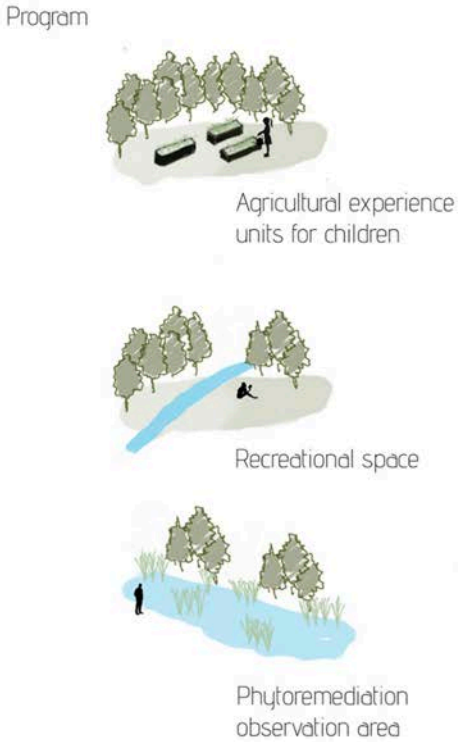

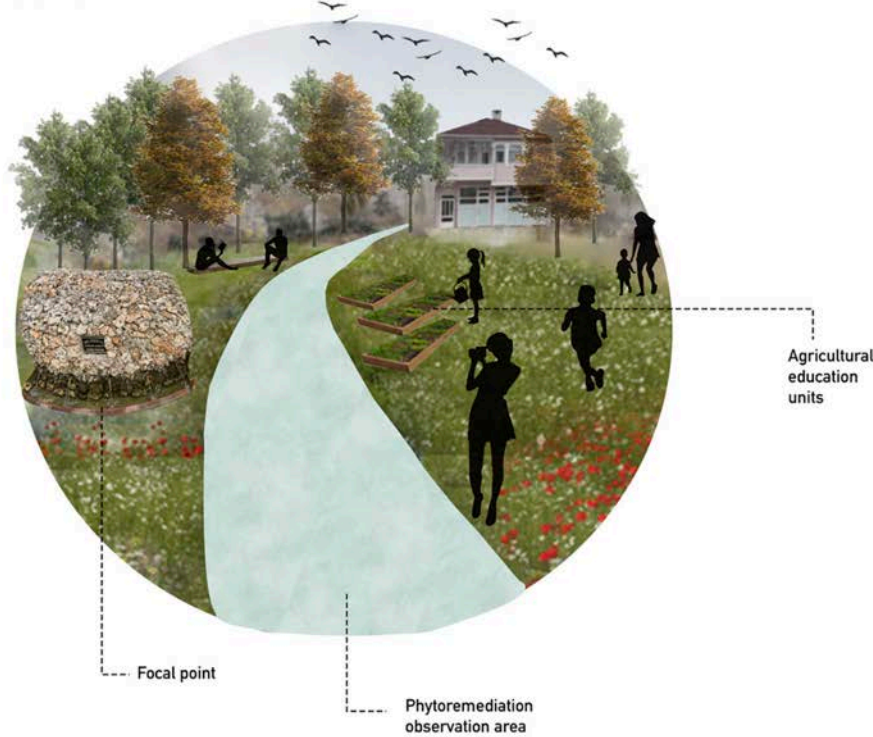

In Cumhuriyet Square, a wall obstructing the canal's water flow was removed, and a cascading system was introduced to improve accessibility. In the Beşçeşmeler region, the water flowing through the canal was naturalized and transformed into an experiential space for children. Additionally, water amphitheaters were created in various locations.

Areas where rainwater collects were identified, and storage solutions were developed. A water amphitheater was proposed for the area where rainwater accumulates, located in the old Cumhuriyet Square, now renamed Tearos Square. Kaynarca becomes a popular tourist destination, especially during the summer.

BEŞÇEŞMELER

Beşçeşmeler was a meeting place for women and young people. Beşçeşmeler, which used to be a meeting place, is now do not reflect the spirit of the area.

AGRO-FORESTRY

This Agricultural site is transformed agroforestry space providing socialization and production. Agroforestry area includes agro-edu center, recreational spaces and wetlands. This area is a field of learning, awareness-raising and experience.

Cumhuriyet Square, which is currently transforming into a parking lot for tours and private vehicles, has become a safety concern due to high traffic flow posing risks to pedestrians. Consequently, the area has been pedestrianized, with roads rearranged to accommodate a two-way service road for emergency vehicles and service businesses. Access to the area is controlled, and a parking lot for ten cars is designated at the entrances. Water-permeable flooring has been chosen to enhance environmental sustainability. In the newly renamed Tearos Square, a market area has been

proposed for local residents to sell their products, featuring temporary structures for market days. On days when the market is not in operation, the space will function as an amphitheater. The courtyard culture, which has developed in Thrace from past to present, has been incorporated into the town's design. Property areas have been arranged and afforested to facilitate communal use. Suggestions include a women's tavern and areas for local production, as well as common agricultural plots where residents can cultivate their own crops.

During the redesign of Cumhuriyet Square, designated spaces for cafes and restaurants have been included. To distinguish it from the main square, a different flooring material has been used. Planting is aimed at creating shaded, cool areas to provide comfort from the sun. Common-use areas in the town have been identified, including children's playgrounds with ziplines, climbing structures, and experiential spaces. These areas will feature colorful rubber and soft flooring materials.

The mosque and water features in the square behind it have been integrated to enhance their visibility and continuity. The former high school site has been terraced and redesigned, with an amphitheater proposed to utilize the site's slope. The space is intended for educational and interactive use, incorporating soft ground and afforestation. Water-efficient plant species like clover have been suggested for the soft soils.

The annual 'Kaynarca Water Festival' is typically held away from the water. To address this, a new square has been proposed in the mill area for festivals and other activities, with a sales point for mill-produced goods. Various soil materials in the town have been identified, and a permeable surface has been proposed to promote water retention. This approach aims to increase the dwindling underground water reserves.

In Turkey and globally, agriculture and industry are the primary contributors to water pollution. Polluted water not only degrades soil quality but also poses significant risks to human health. With the industrialization of the Ergene basin, water and soil pollution have increased substantially. To address this, a wetland area has been proposed for phytoremediation, using plants to cleanse the water and reduce soil pollution on a regional scale. Trees in this area are chosen for their resistance to water. The wetland, which is typically wet in winter, can serve as a recreational area in the summer as water evaporates with the heat. A footbridge has also been constructed over the wetland, with part of the area designated as an experiential space for children.

In the Beşçeşmeler region, the children's playground has been redesigned with plastic play elements that complement the surrounding wood and area. Additionally, a water experience zone for children has been integrated into the playground.

Kaynarca is situated along the Thrace vineyard route extending to Çanakkale. The vineyards have been strategically positioned considering their wind and water needs. The area includes rainwater storage ponds, a production facility, restaurants, training and workshop areas, and a small hotel for guests. These developments are expected to boost visitor numbers to the town and diversify income sources, with tourism becoming a significant economic contributor alongside agriculture and industry.

It is proposed that 500 m² of currently unused fertile agricultural land per resident be converted into community gardens. This initiative aims to revitalize idle land and encourage its productive use.

PROJE IV

LANDSCAPE DESIGN IV

Dynamic Hereke

S. Gülşah Domucukgöl

"Dynamic Hereke" was produced within the scope of Landscape Design IV carried out by Assoc. Prof. Gülşen Aytaç, PhD., Res. Assists. Merve Fermancı under the title "Weaving Landscapes" in the fall semester of 2019-2020.

374

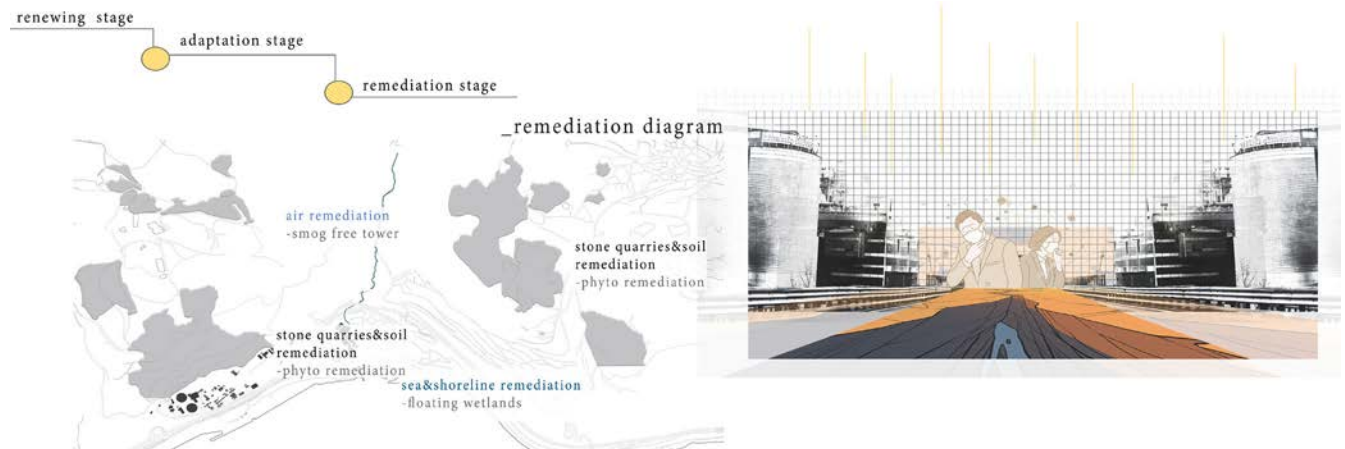

The main objective of this project is to create a dynamic city in Hereke, a region that has been heavily affected by industrial pollution and has experienced many disasters in the past. The goal is to design a resilient urban environment capable of withstanding future challenges such as disasters and pollution. To achieve this, we began by identifying the area's weaknesses, such as air, water, and soil pollution, and analyzing potential future disasters. These issues form the core of the project.

The solutions were developed in three stages: healing, adaptation, and re-use. After identifying the main problems, the next step was to explore how to create a dynamic city that could adapt to these challenges.

Hereke is significantly impacted by pollution from local industries, affecting the air, water, and soil. To address this, plant-based solutions, such as phytoremediation and floating wetlands, were proposed to clean the air and soil. Retention ponds were also suggested at key intervals to prevent contaminants from reaching the soil directly. Additionally, a greenbelt was recommended to protect the area from external sources of air pollution.

375

_sea level rise 2019 -> 2100

As Hereke is located in the first earthquake zone, earthquake preparedness became a key consideration. Emergency gathering areas and specialized earthquake corridors were proposed to ensure safety during seismic events. To address future water elevation concerns, especially with projections for 2050 and 2100, three critical areas were identified for adaptation. Platforms were designed to adapt to rising water levels, ensuring the continuity of important spaces even with environmental changes.

The existing cement plant, which has caused significant environmental damage, was proposed for closure. Employment from the cement factory would be redirected to other industries to reduce the negative impact on the local workforce. To further improve environmental conditions, the green spaces within the industrial park were connected through a green-oriented design, ensuring continuity between these areas. New agricultural parcels were also proposed to link fragmented farmlands, strengthening the agricultural network.

To address the disconnection between historic sites, corridors were proposed to reconnect and enhance these areas, ensuring both preservation and functionality. The Sümerbank factory, which had lost its original function, was reimagined as a space for carpet weaving workshops and recreational activities, revitalizing the area's industrial heritage while creating new community spaces.

A major transportation overhaul was also proposed, including placing the heavily trafficked viaduct underground near the existing railway station. Green corridors were designed to connect quarries, improving ecological support and creating continuous green spaces.

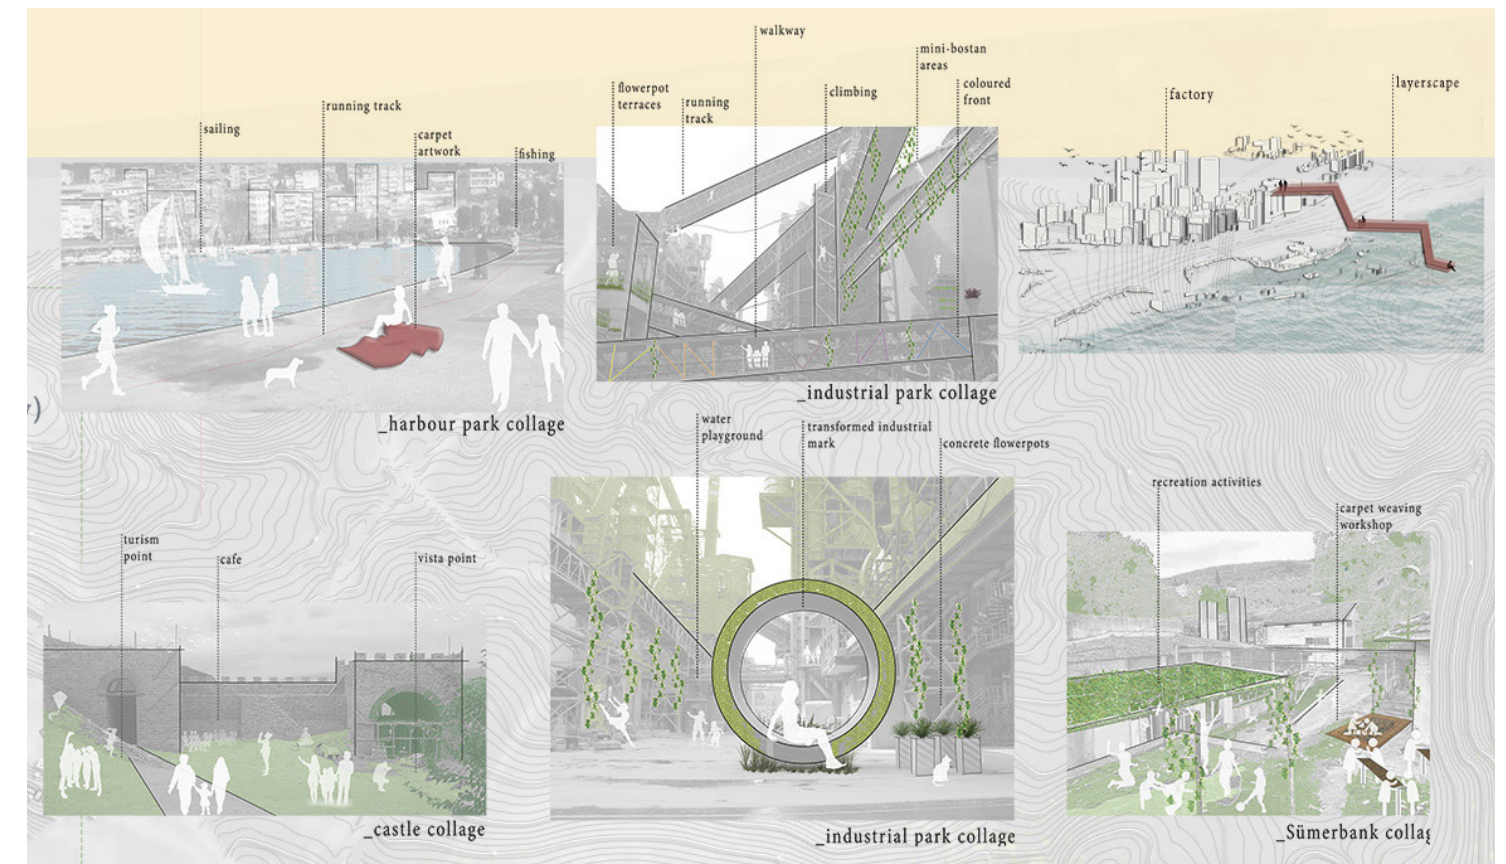

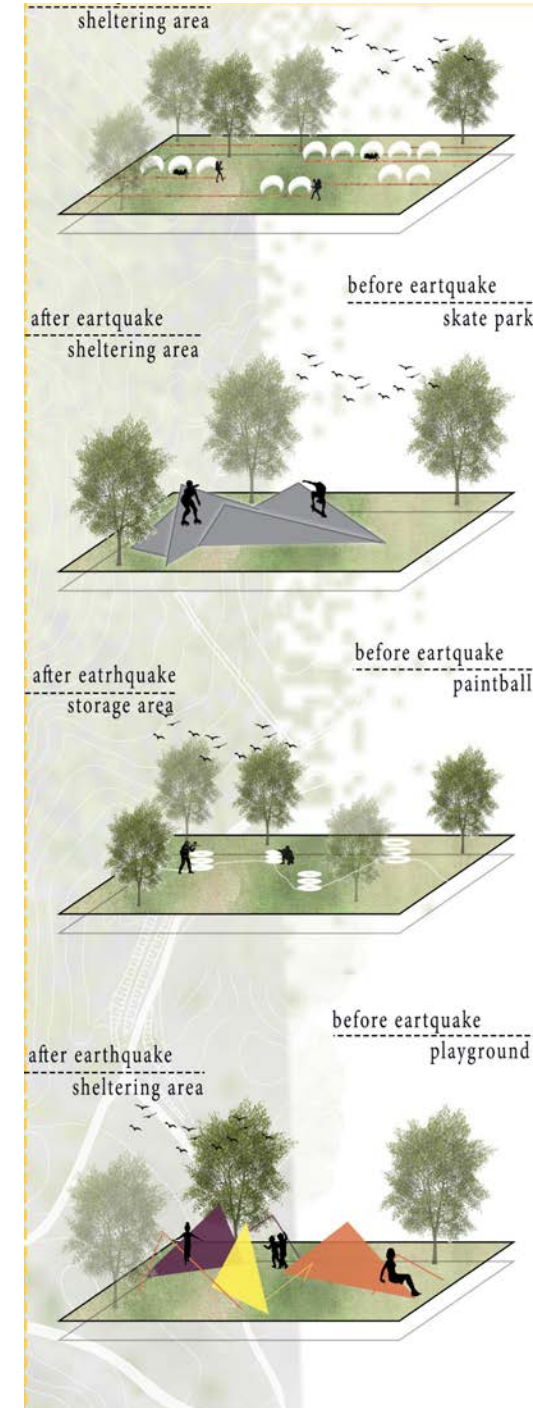

Additionally, wetland buffer zones were proposed along the creek to support the ecosystem and maintain ecological balance.

Hereke has experienced numerous earthquakes throughout its history. To mitigate the impact of future seismic events, a quarry site on the upper side of the earthquake park was rehabilitated and transformed into a multi-functional community space. This space includes children's playgrounds, paintball fields, sports facilities, skate parks, festival grounds, healing gardens, camping areas, and a neighborhood market. Underground storage was integrated into the design to provide warehouses for post-disaster supplies. The areas were designed with dual functionality, serving

the community both before and after an earthquake.

In the aftermath of an earthquake, the primary needs of the community include water, food, energy, sanitation, and shelter. These needs were carefully considered in the design of the spaces to ensure they would be equipped to support the population during a crisis. Alternative energy solutions, such as solar panels, hydropower, solar energy fields, frictional energy, and energy-producing pavement systems, were proposed to ensure the community's resilience and self-sufficiency in the event of a disaster.

Eco-zone

Erzi Terzioğlu, Çağla Kaplan

"Eco-Zone" was produced within the scope of Landscape Design IV carried out by Prof. Dr. Gülşen Aytaç, Res. Assists. Merve Fermancı under the title "Weaving Landscapes" in the fall semester of 2019-2020.

In our project area, Hereke, we began by analyzing the current situation with a future scenario in mind, looking ahead 50 to 100 years. We observed that the population and housing demand in the city continue to rise each year, as indicated by statistical data. Alongside this increasing demand for housing, we also noticed a concerning decrease in green spaces, which we aimed to address. The Nuh Çimento Concrete Factory, located in the center of Hereke, is a key functional industrial site. However, given that the factory will require renewal within the next 50 to 100 years, we proposed relocating the factory to another industrial zone within Hereke, where other factories are already situated. This relocation would allow the factory to modernize while the budget allocated for its renewal could be used to establish a new industrial zone. By moving the factory, we freed up valuable space in the city center that could be repurposed to meet the city's needs and made accessible for public use through various activities. Our goal was to envision a transformation of this area into an eco-city that generates its own energy, and to extend this model throughout

Hereke. We started with this transformation area and expanded the strategy to other parts of the city, which we mapped out on a 1:5000 scale. In our strategy, we created a zoning plan and developed a work-life cycle for various user groups, which we illustrated in a user diagram. This strategy also prioritized biodiversity, green roofs, compost recovery, water efficiency (including gray water use), building automation, seaweed energy production, high levels of insulation, and sustainable farming. As part of the transformation, we repurposed the factory's silos for compost recovery. One silo was designated for organic waste, while the other was used for domestic waste incineration. The energy generated from this process was returned to the city as electricity and heat. Additionally, to support heat production in buildings, we developed a unique wall system on various facades that generates heat using seaweed. This system not only serves as a sustainable energy source but also creates an aesthetically pleasing exterior that resembles an aquarium.

Other silos; rain water deposition and urine collection - holding areas as the vertical garden and landscaping areas used for irrigation. Bicycles have been integrated to generate energy for open spaces, offices, and schools. Additionally, energy buttons have been placed in seating areas, allowing users to press the button and produce energy. To improve accessibility, we designed walking and cycling paths throughout the area.

For sustainable farming, we established agricultural fields, vertical gardens, and botanical greenhouses. C-4 plants were used in the roof gardens. We also created an algae pool for the production of algae, which serves as a raw material for pills that help meet a person's daily nutritional needs. This approach aims to minimize consumption.

We proposed various residential typologies for the project area, carefully considering the existing demographic profile. Our housing diagram reflects these proposals, offering options for apartments, detached homes, garden-level units, and slum housing.

The project emphasizes public accessibility rather than a closed design. In this context, we designed essential facilities such as health units, schools, research centers, offices, and commercial markets. In addition, we created spaces for entertainment and socializing, including an open-air cinema, amusement park, recreation hubs offering different viewing experiences, a tree museum, and exhibition areas.

Proactive Interferences

Meltem Atalay

"Pro-active Interferences" was produced within the scope of Landscape Design IV carried out by Prof. Dr. Gülşen Aytaç, Res. Assists. Merve Fermancı under the title "Weaving Landscapes" in the fall semester of 2019-2020.

386

The project site is located on the İzmit Gulf, 60 km (45 minutes) from Kadıköy, İstanbul, making it an attractive destination for urban residents. However, the site is also just 13 km away from Dilovası/İzmit, an area known for its significant environmental pollution and the dangers it poses to residents. As an industrial region causing pollution, Dilovası also impacts the Hereke region, putting pressure on the land and threatening the local ecology with its expansion demands.

First Impressions

When observing Hereke from the coastline, key landmarks such as Nuh Cement Harbour, Nuh Cement buildings, Hereke Castle, the Hereke Viaduct, and the marina stand out. The topography of the site can also be sensed to some degree.

History of Hereke

The history of Hereke dates back to the Roman Empire and the Byzantine era. Over time, several important landmarks were

added to the site, including the Hereke Weaving Factory in the 1800s and the Sümerbank Factory in the 1930s. Nuh Cement Factory also began operations in the 1960s. Other historical features include the Kaiser Wilhelm Pavilion and Hereke Castle, which were built during different periods.

Lost Values

Before the construction of Nuh Cement buildings and the operation of numerous quarries, Hereke was known for various cultural events, such as the "Cherry Festival" and "Vineyard Festival." The region was famous for its olives, cherries, lilies (around the viaduct area), Judas trees (especially near the castle), limestone, and its globally recognized fabrics and carpets.

Weaving and Planning Approach

Weaving is a key concept for both the site and the project. The tradition of weaving in Hereke began with hand looms and evolved through the use of Jacquard looms and large-scale

387

factory production. Weaving consists of three main components: warps, wefts, and knots. To create a pattern, a reference matrix is required. In this matrix, each square corresponds to a knot in the weaving process.

What if Hereke itself were a fabric or carpet being woven? What would its pattern matrix look like? To transform the site, we first need to examine its existing pattern matrix. By identifying troubled knots, we can eliminate them and add new knots, creating a new matrix. This new matrix will not be static; it will undergo processes and evolve into something better at various stages.

Proactive Interventions

The term “proactive” refers to anticipating needs, problems, or changes. Proactive interventions aim to address these in advance for Hereke’s future. These interventions may include taking precautions, adding features, or shaping the site over time to achieve a desired outcome—essentially “fermenting” the site into a more sustainable form.

Coarse Textures of Hereke

Hereke contains six main textures: quarries, Nuh Cement Factory buildings, residential zones, the Nuh Cement Factory harbour, the coastline of Hereke, and the green system.

Neighbourhood Units Around the Site

Neighbourhood units are crucial to understanding the settlement typologies that are planned to be integrated into the project. Without a clear understanding of the surrounding areas, an effective approach cannot be developed. The main neighbourhood units around the site include Dilovası, Agah Ateş, Hacı Akif, Kışladüzü, 17 Ağustos, Cumhuriyet, and Yukarı Hereke. Dilovası is a significant factor due to its expanding territory and high pollution levels. On the other hand, Cumhuriyet is a recently developed area, home to a mostly southeastern migrant population, with limited social services and uncontrolled housing development.

Problems, Opportunities, and Suggestions

In Hereke’s context, problems can also be opportunities, and vice versa. To address this complex situation, the project proposes a two-phase intervention strategy:

YEAR 2100-ENERGY AND PRODUCTION METHODS

Phase I:

Immediate closure of quarries and a succession process for decommissioning them; Gradual reduction of factory operations, with workforce transitions to cleaning activities; Elimination of factory operations and their long-term impact; Transformation of the historical center of Hereke into a residential-delta hybrid.

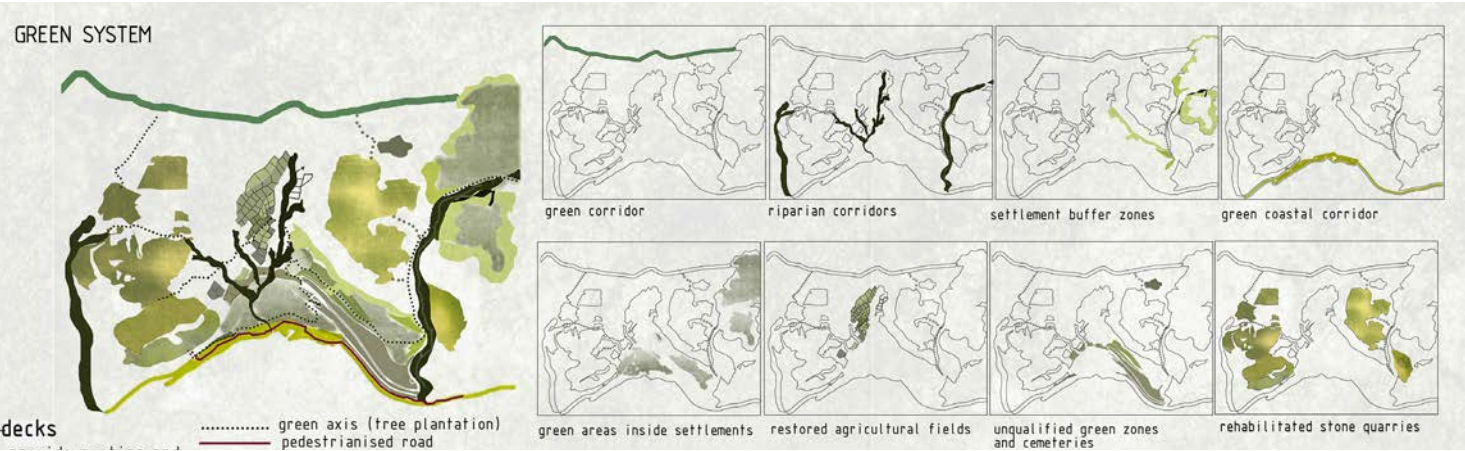

Phase II:

Increasing water efficiency; Material recycling; Promoting alternative energy sources; Encouraging the use of regional materials; Supporting alternative travel options; Restoring and promoting social activities.

Repeating Patterns in Hereke – Above and Below

There are recurring patterns throughout the Hereke site. For instance, at Nuh Cement Factory, connection structures that transfer materials between buildings create an interconnected, woven texture. Similarly, the viaducts create intersections of roads and bridges that connect and weave spaces at different levels. The railroad in central Hereke also divides the settlement into two parts, with underpasses connecting them. These elements, which might typically be seen as barriers or separators, can function as connectors, especially in the context of green spaces.

“Connecting the greens via these elements is a key tool in our proactive intervention approach.”

Revitalizing Hereke, Long-term Landscape Strategy_Retreiving Natural

Mehmet Bulut

"Revitalizing Hereke, Long-term Landscape Strategy_Retreiving Natural Landscape " was produced within the scope of Landscape Design IV carried out by Prof. Dr. Gülşen Aytaç, Res. Assists. Merve Fermancı under the title "Weaving Landscapes" in the fall semester of 2019-2020.

390

- [current problems]_Hereke
1. misuse of a natural landscape area
 2. presence of the cement factory
 3. forthcoming natural reality: globak warming /high tide
 4. lack of recyclable energy use and management
 5. fragmented &displeased demographical structure
 6. decrease of bio-diversity

[act_1] Fertile Rural Model vs. Pervasive Industry
Creating Rural Potential and Opportunities Against Heavy, Invasive Industry

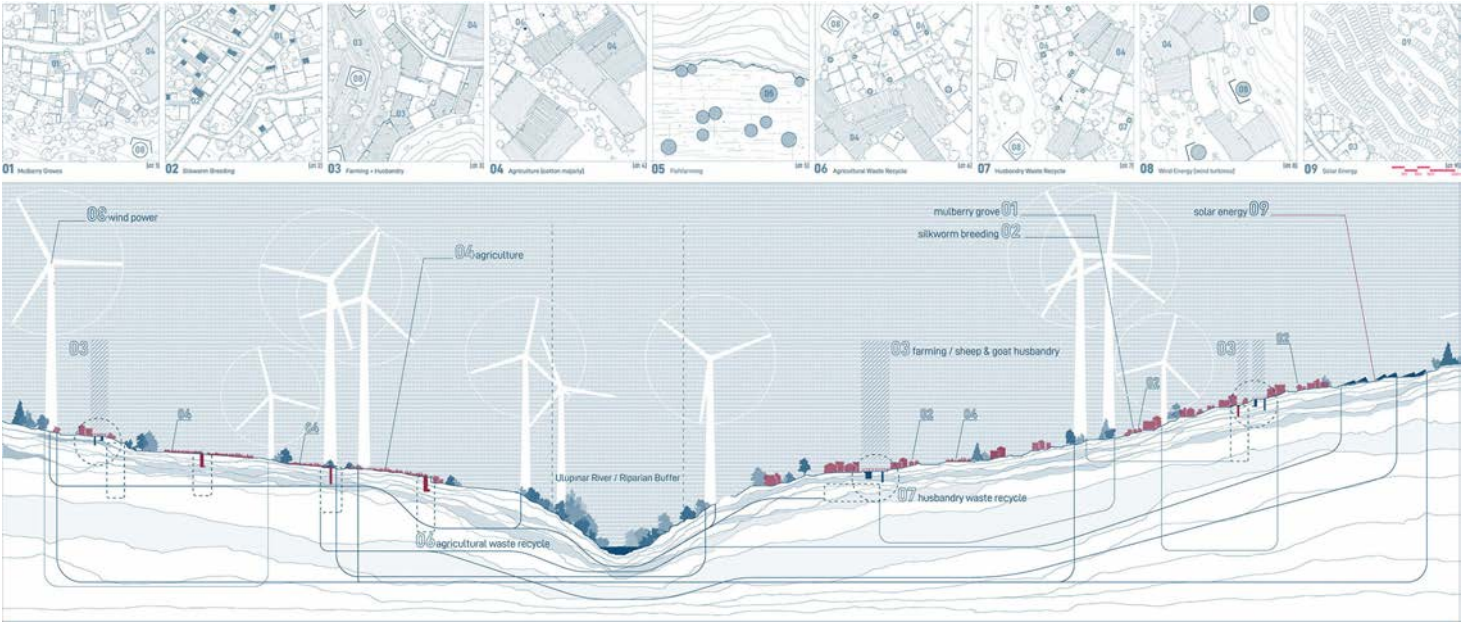

This project aims to create an alternative local economic source rooted in the original identity of Hereke by promoting agricultural and husbandry-based activities along the valley. These include mulberry cultivation, cotton production, silkworm breeding, and sheep and goat farming. By introducing this rural organization, the goal is to offer a practical and sustainable landscape element that can counterbalance the expansion and dominance of nearby industrial activities, particularly the cement factory. This rural approach is designed as a model for the new era of our polluted ecology. It combines traditional rural characteristics with renewable energy technologies, such as wind power, solar energy, and waste recycling systems (biomass, biogas, bio-compost). Moreover, this phase of the project represents the beginning of a long-term landscape strategy, marking at least a 100-year process of transformation.

Rural Characteristics of [act]

Mulberry Grove
Mulberry fields are an essential part of the rural setting, primarily serving to feed silkworms. Since mulberry leaves are the only food source for silkworms, their cultivation is a crucial component of this rural plan. In addition to supporting silkworm breeding, mulberries will also be used in wine production, adding another layer of value to the local economy.

Silkworm Breeding
Silkworm breeding plays a vital role in reviving the carpet industry, which once thrived in Hereke but has since declined. By producing silk—the primary raw material for Hereke’s famous carpets—this initiative will not only revitalize the carpet industry but also provide new employment opportunities. Silkworm breeding houses and fields will serve as productive spaces, helping to reintegrate silk production into the local economy.

391

Sheep & Goat Farming
Sheep and goat farming will support the carpet industry through wool production while offering additional employment opportunities. Grazing fields, pastures, and farms will help create a sustainable rural economy and increase the value of Hereke's local agriculture. This will provide fertile, organic, and productive opportunities for daily life.

Agriculture
Agriculture is a significant asset to any rural community, and in Hereke, the focus on cotton production presents immense potential. Agriculture not only strengthens the local economy but also supports the carpet industry, offering a valuable and sustainable resource for Hereke's future.

Fish Farming / Aquaculture
Fishing has historically been an important industry in Hereke, but it has declined due to pollution caused by the cement factory. Fish farming, however, offers a sustainable alternative. By introducing aquaculture, fishermen can continue their activities offshore, and through sea-cleaning strategies, fishing will once again become a viable industry in the area.

Energy Characteristics of [act_1]
Waste Recycling Energy
Following a waste management strategy, agricultural and husbandry waste will be converted into energy through various recycling methods, such as biomass, biogas, and bio-compost. These systems will support the local energy economy and ecology, with potential for producing materials for the fish farming industry as well.

Wind Power
Wind power is an efficient and environmentally friendly energy source, particularly in areas with strong wind currents. Hereke's location, with its favorable wind conditions, is ideal for integrating wind power into the rural organization. Wind turbines—both onshore and offshore—will provide energy for various infrastructure needs, including houses, factories, agricultural activities, and farms. The turbines will also generate economic benefits, complementing other rural features in Hereke.

Solar Energy
Solar energy will be integrated into the rural model, with solar panels placed alongside the agricultural and rural features. These panels will supply electricity for essential activities, such as irrigation, household power, and farm operations. Solar energy will not only make the rural organization more self-sufficient but will also contribute to the local economy by providing clean, renewable energy.

Loop-up

Evrim Elif Yurttaş

“Loop-up” was produced within the scope of Landscape Design IV carried out by Prof. Dr. Gülşen Aytaç, Res. Assists. Merve Fermancı under the title “Weaving Landscapes” in the fall semester of 2019-2020.

394

Hereke has historically been a production city, and its legacy of manufacturing continues today. In the past, Hereke's production evolved into an art form, with the city's name becoming globally renowned for its carpets. Today, its cement industry plays a significant role in the world's cement market as an engineering product. Both of these major industries have benefitted from natural resources. The carpet industry is supported by the livestock ecosystem, and its designs are often inspired by plant leaf motifs. In contrast, the cement industry relies on the region's geological resources, which are extracted irreversibly, leaving behind significant pollution. This has resulted in a negative perception of production in the city. However, it is possible to change this negative view of production by addressing the pollution with a new form of large-scale, sustainable production: Biomass. Algae, which are highly efficient at carbon capture, can be produced on an industrial scale. Many of the nutrients needed for algae cultivation—such as nitrogen, phosphorus, and carbon dioxide—are pollutants that harm nature, contaminate water, and degrade soil. In areas where the factory has disturbed the landscape, such as the site of the first excavation, the existing terraces have been reorganized into a terraced system to support

new production methods. The following species of cyanobacteria have been proposed for large-scale algae production: Arthrospira platensis (spirulina) and Phaeodactylum tricornutum. Additionally, agroforestry—a land management system in which trees or shrubs are grown alongside crops or pasture—has been proposed for areas that maintain their topographic features. Agroforestry helps to regenerate the soil and improve its health by integrating tree planting with agricultural activities. The trees will also serve as a source of biomass energy. For the agroforestry system, the following species have been suggested for the Marmara region: Pinus pinaster; Pinus radiata; Pseudotsuga menziesii; Alnus barbata. C4 plants, which are commonly used for biomass energy production, have been recommended as an alternative to algae for regenerating the soil and making otherwise idle land productive. Given the region's climatic conditions, the following species have been selected for biomass cultivation: Corn (Zea mays); Sweet corn (Zea mays sacharata); Soybean (Glycine max); Sorghum (Sorghum vulgare); Canola (Brassica napus); Miscanthus (Miscanthus giganteus); Safflower (Carthamus tinctorius); Jatropha (Jatropha curcas); Switchgrass (Panicum virgatum) Seaweed farming offers a sustainable and renewable biomass

395

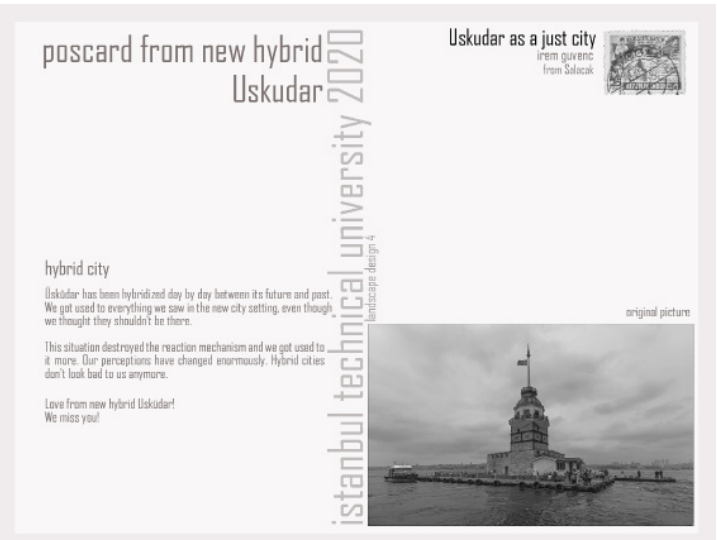

source. Seaweeds grow faster than any land-based plants and provide numerous environmental benefits. They increase biodiversity, oxygenate the water, and improve fish stocks around farming areas. Seaweed farming is proposed as a new recreational area along the coast, where it can also serve as a rich source of biomass. Additionally, seaweed will help mitigate pollution from the factory, which has contaminated the old port area for many years. In the İzmit Gulf, contamination from ships waiting to enter the Bosphorus has also degraded water quality. Seaweed's ability to act as a biofilter (bioremediation) can help reduce coastal eutrophication and improve water quality. Through these efforts, Hereke can transform its industrial past into a more sustainable and ecologically positive future.

Postcards from the just cities

Ece Özerlerer, Pelin Kutsal, İrem Güvenç, Abdullah Bahaeddin Akçay

“Postcards from the just cities” was produced within the scope of Landscape Design IV carried out by Prof. Dr. Hayriye Eşbah Tunçay, Prof. Dr. Gülşen Aytaç, Res. Assists. Başak Akarsu and Res. Assist. Gizem Aluçlu under the title “Landscape Architecture for Just City” in the fall semester of 2020-2021.

396

397

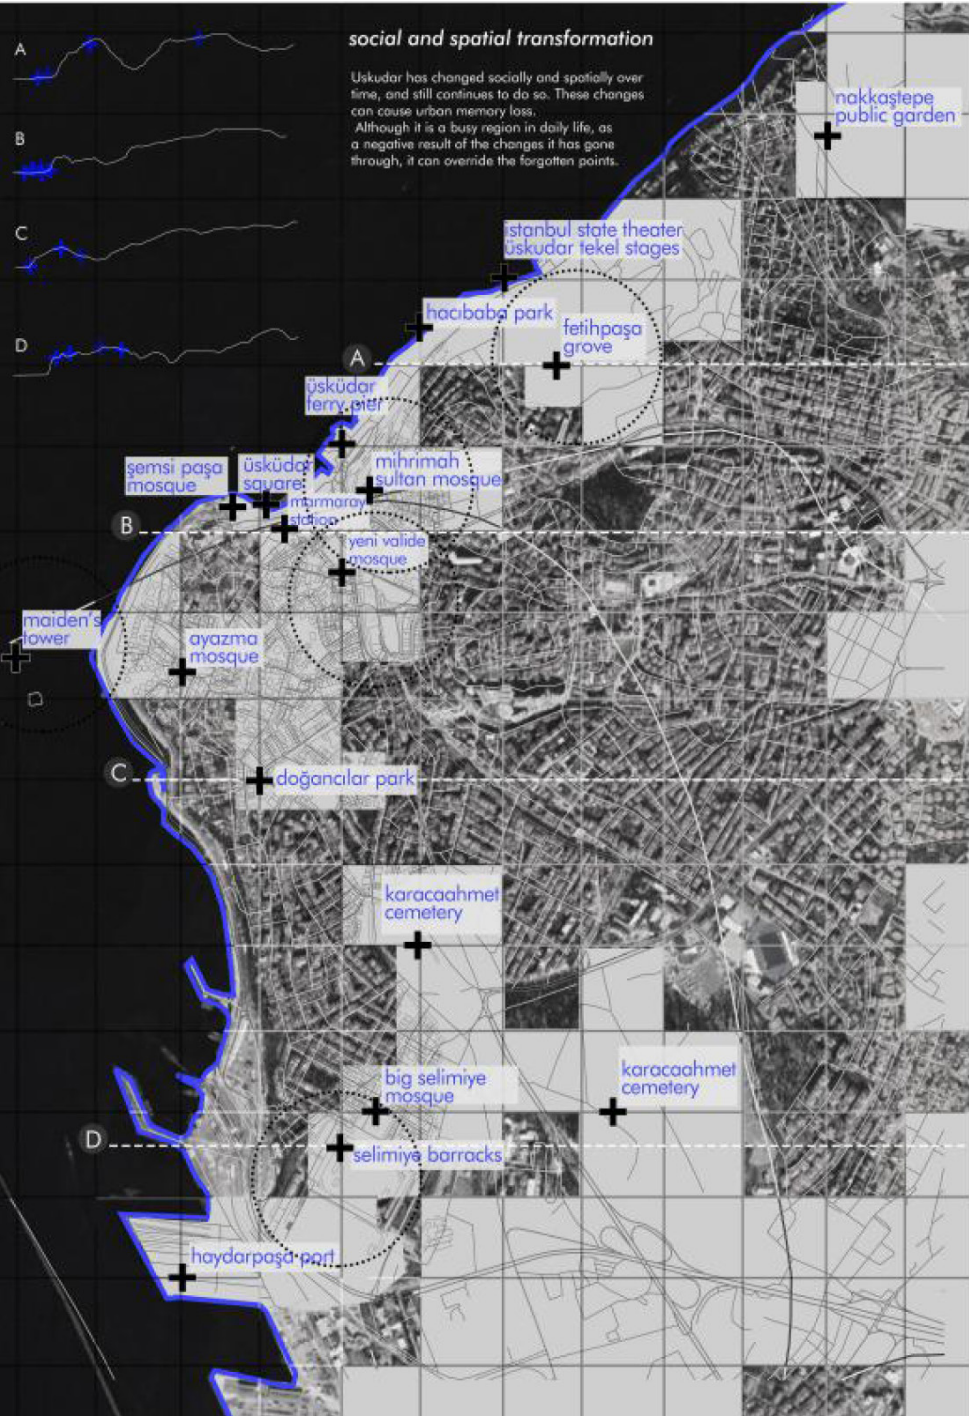

Examining The Urban Transformation in Üsküdar

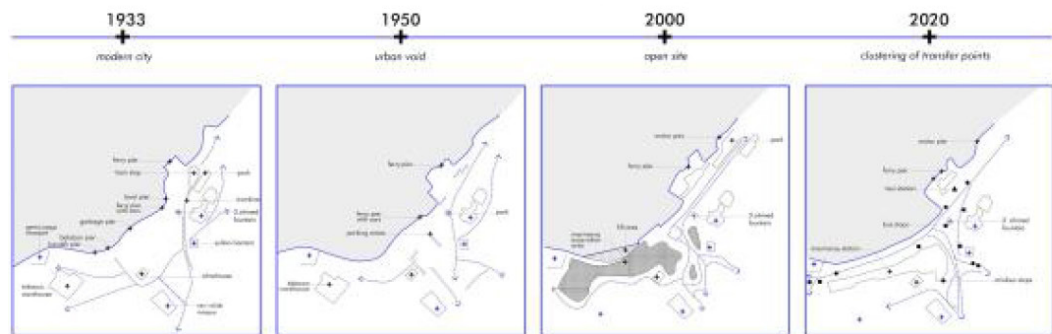

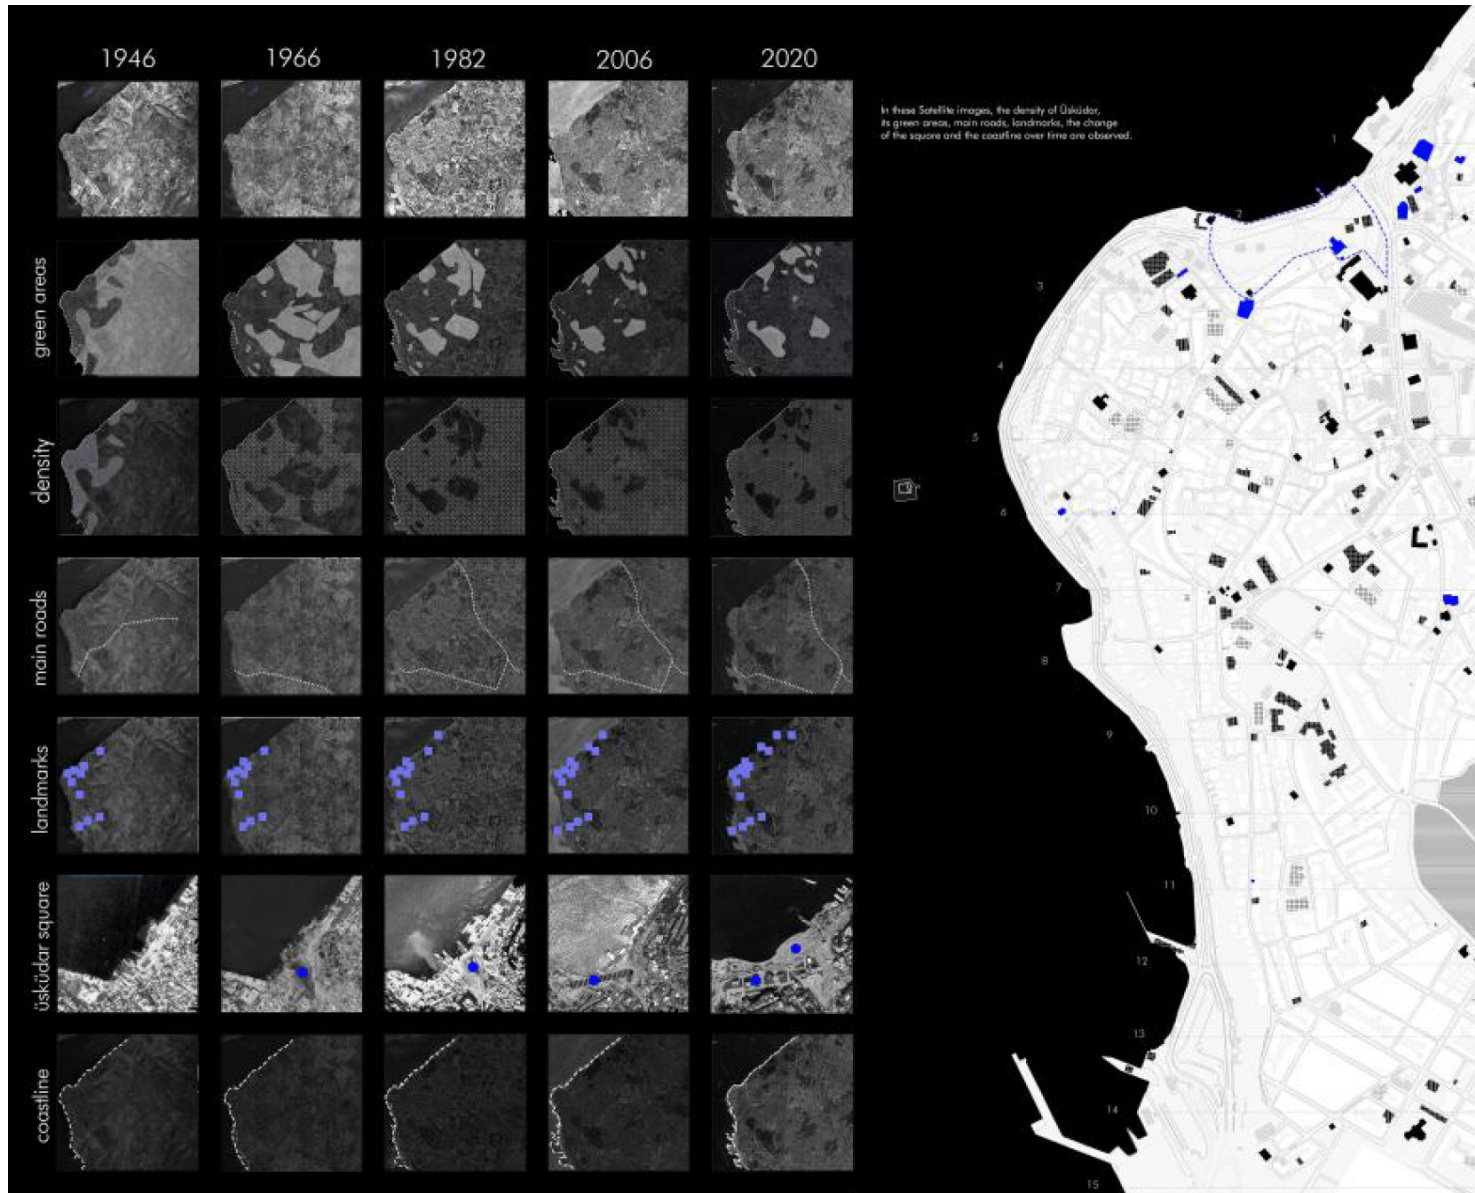

Ece Özerlerer

“Examining The Urban Transformation In Üsküdar” was produced within the scope of Landscape Design IV carried out by Prof. Dr. Hayriye Eşbah Tunçay, Prof. Dr. Gülşen Aytaç, Res. Assists. Başak Akarsu and Res. Assist. Gizem Aluçlu under the title “Landscape Architecture for Just City” in the fall semester of 2020-2021.

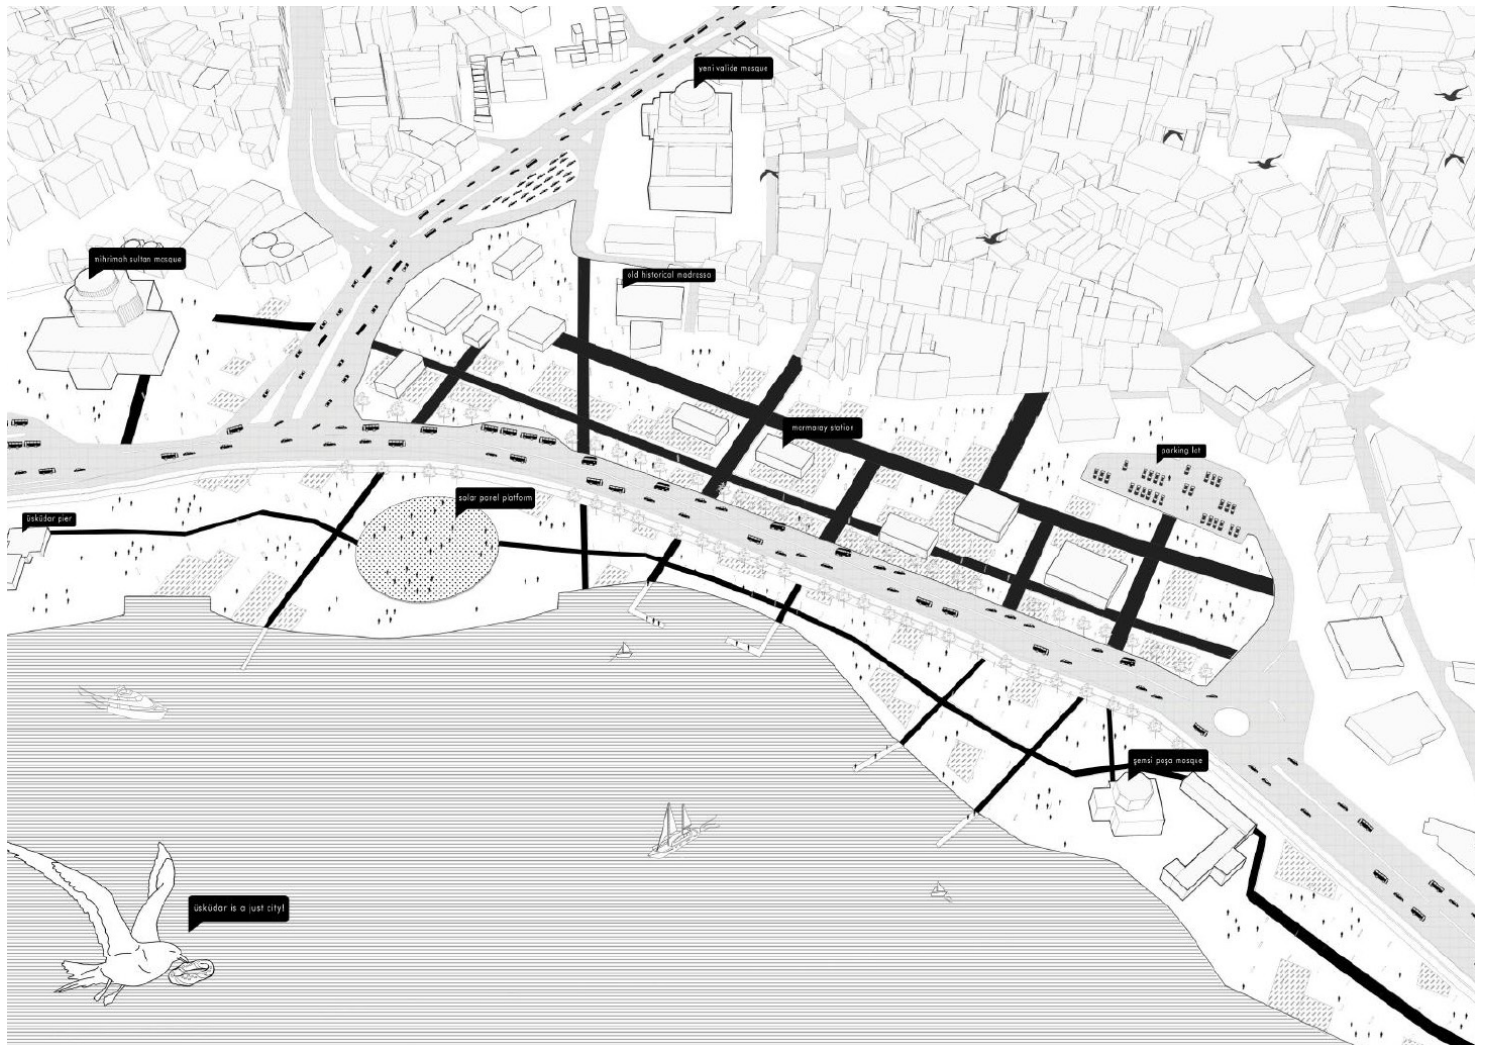

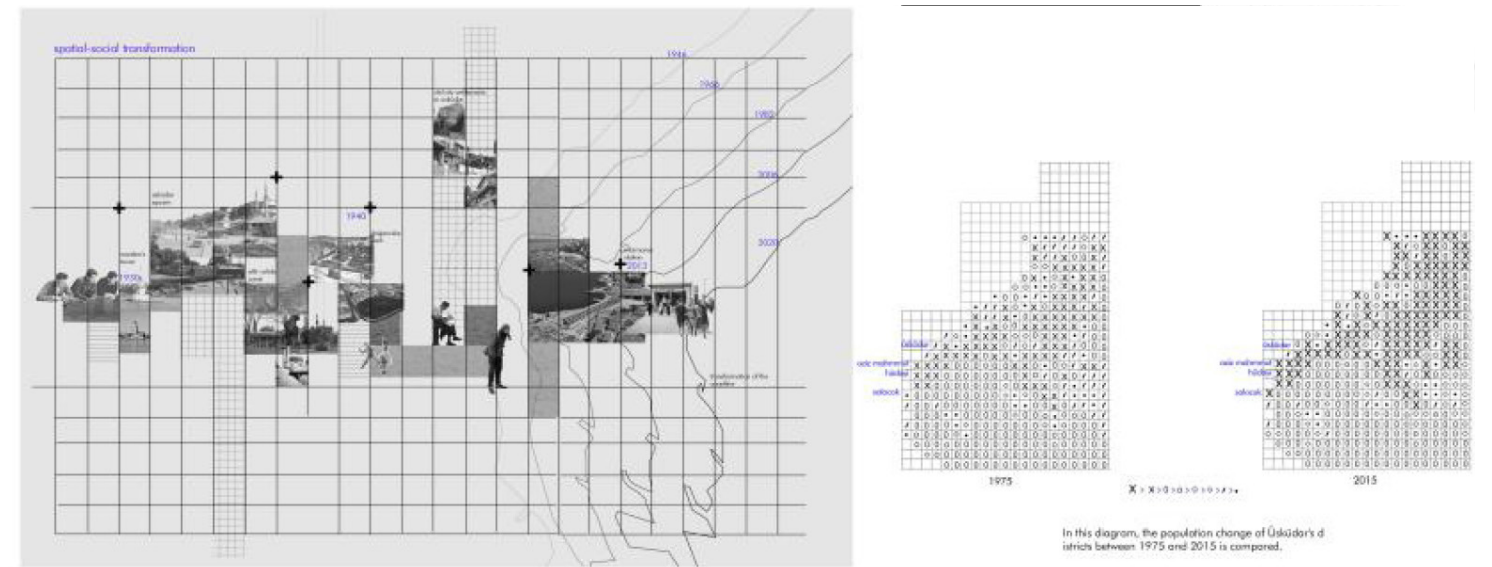

This exploration of ordinary and forgotten urban qualities examines the overlooked spaces within the everyday environment. The environment, situated between the familiar nature of the ordinary and the act of searching, reflects the spatial assumptions we impose on our surroundings. As a society, we frequently overlook the fabric of our urban environment, often neglecting these spaces mentally, despite their presence. This neglect influences how we perceive and experience these spaces. The interconnected thresholds, edges, roads, nodes, and spatially neglected landscapes that make up the urban fabric of Üsküdar exist as ordinary and forgotten spaces within the framework of daily life. We often pass through these corridors as part of our daily routine, but we fail to recognize their significance, instead using them merely as transitional spaces. As social and spatial transformations continue to unfold, we tend to forget these everyday urban elements, losing awareness of them. The purpose of focusing on the transformations in Üsküdar is to identify areas with potential for change and to uncover new structures and patterns within the urban fabric. This process involves not only physical intervention but also the discovery and appreciation of unnoticed features. In conclusion, to support these objectives, a design intervention has been proposed to make the busy areas of Üsküdar more engaging for people’s everyday lives. Through this approach, the city square can be redefined in multiple ways.

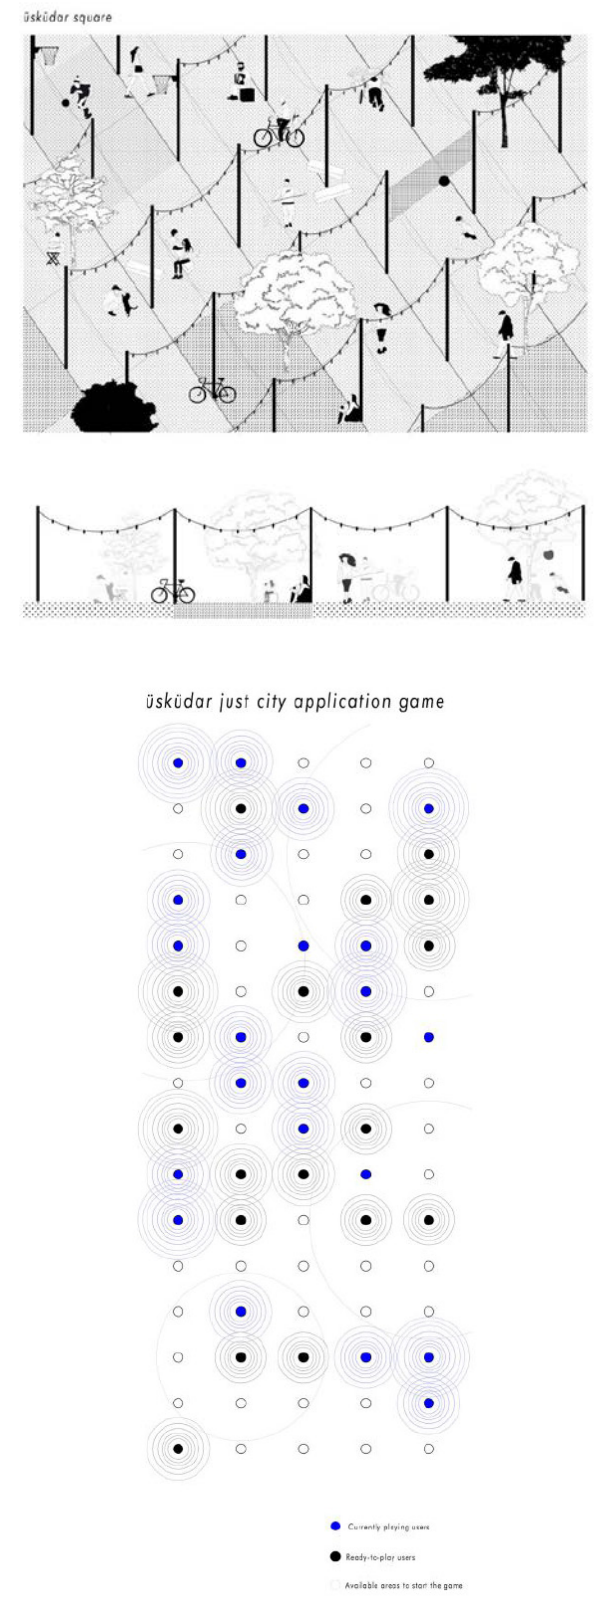

spatial transformation of the Üsküdar square

Which factors lead to the change of the Üsküdar Square over time and the alienation from the space?
Today, Üsküdar Transfer Center, intersection of interspecies transport stations with pedestrian links, location and has a cosmopolitan user base due to its transportation at the same time carrying identity value with its historical feature is a field. On the highway; bus, minibüs, minibüs, private vehicle on the railway; tube-gate system Marmaray, marine on the way; Transfer by ferry and motor between different types of transport and stations by pedestrian connections and flows takes place

Üsküdar as a Just City: Landscape Architecture for Just

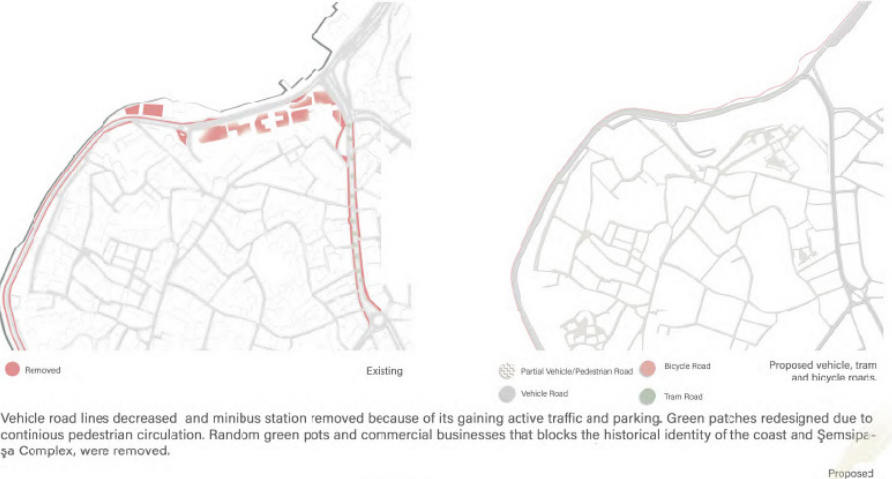

Mehmet Taylan Tosun

“Üsküdar as a Just City: Landscape Architecture for Just City” was produced within the scope of Landscape Design IV carried out by Prof. Dr. Hayriye Eşbah Tunçay, Prof. Dr. Gülşen Aytaç, Res. Assists. Başak Akarsu and Res. Assist. Gizem Aluçlu under the title “Landscape Architecture for Just City” in the fall semester of 2020-2021.

CREATING A CONTINUOUS PEDESTRIAN CIRCULATION PEDESTRIAN-FRIENDLY STRATEGY

For a pedestrian-oriented district, all kinds of obstacles to disrupt pedestrian circulation have been replaced with a more functional and human-scale design due to the concept.

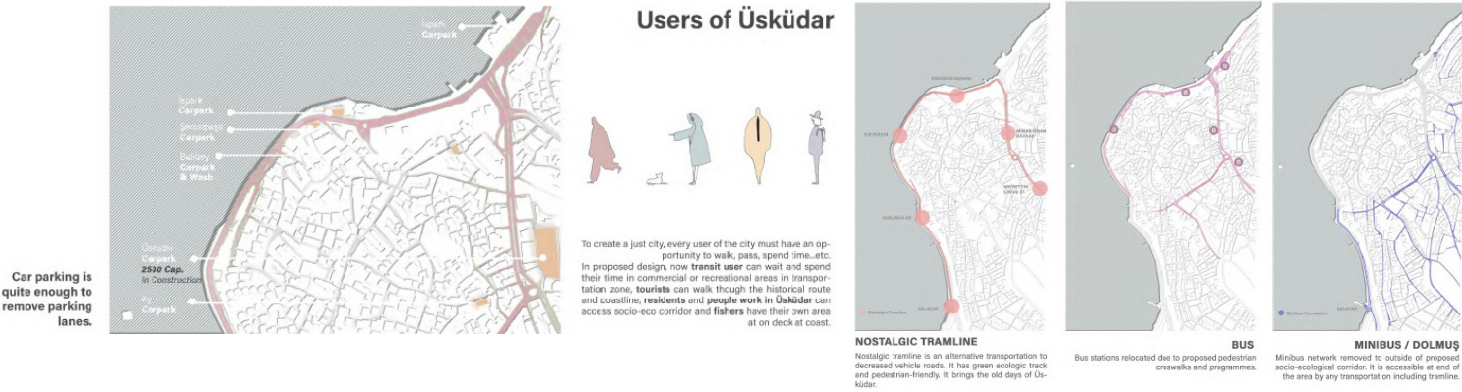

Vehicle road lines decreased and minibus station removed because of its gaining active traffic and parking. Green patches redesigned due to continuous pedestrian circulation. Random green pots and commercial businesses that blocks the historical identity of the coast and Şemsipaşa Complex, were removed.

Proposed pedestrian circulation creates historical routes for every user of Üsküdar. Rather than being just a transit point, Üsküdar turns into a place to spend time emphasizing important historical textures. With the green areas used on the sidewalks, the pedestrian is separated from the view and noise of the road and concentrates on Üsküdar.

CREATING ALTERNATIVE TRANSPORTATION without interrupting pedestrian circulation

Car parking is quite enough to remove parking lanes.

DESIGN STRATEGIES

In the Proposed Context of Socio-Ecological Corridor

ECOLOGICAL STRATEGIES

CAR PARKS TO BIOSWALES

Two of the 4 lanes are used for parking on long streets such as Hakimiyet-i Milliye and the coastline, where the city rain water accumulates. For the health of blue and green infrastructure, car parking lanes are turned into bioswale areas. Flood risk is prevented for the city and pedestrians are given priority for the concept of a fair city.

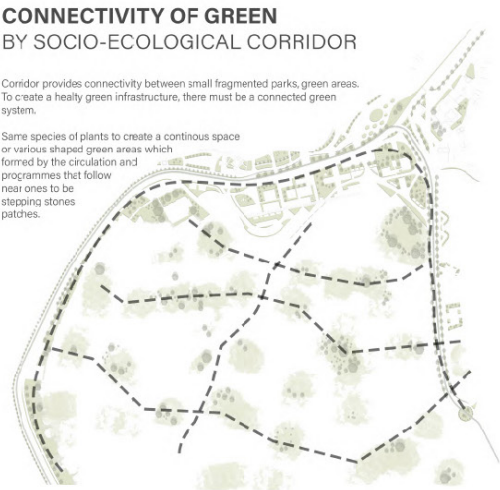

CONNECTIVITY OF GREEN

BY SOCIO-ECOLOGICAL CORRIDOR

Corridor provides connectivity between small fragmented parks, green areas. To create a healthy green infrastructure, there must be a connected green system.

Same species of plants to create a continuous space or various shaped green areas which formed by the circulation and programmes that follow near ones to be stepping stones patches.

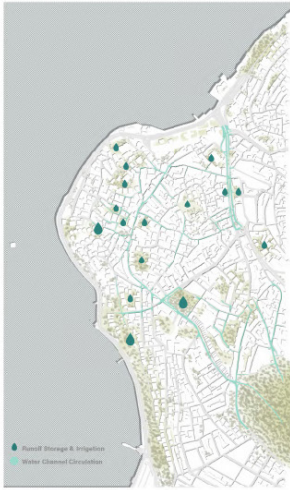

ECOLOGICAL STRATEGIES

STORAGE OF RUNOFF WATER

In topographically rich Üsküdar, while residential settlements are higher, urban active streets turn into lower valleys where water is collected. With the new design proposal, the rainwater will be transferred to the new pocket parks on the hills by slope, the remaining water will be mixed into the soil with the bioswale proposal or the main streets. Infrastructures for collecting and storing rainwater will be found under green areas and made available to use in the city, and with this urban blue infrastructure, the flood problem will be solved with an ecological and economic strategy.

PLANTING

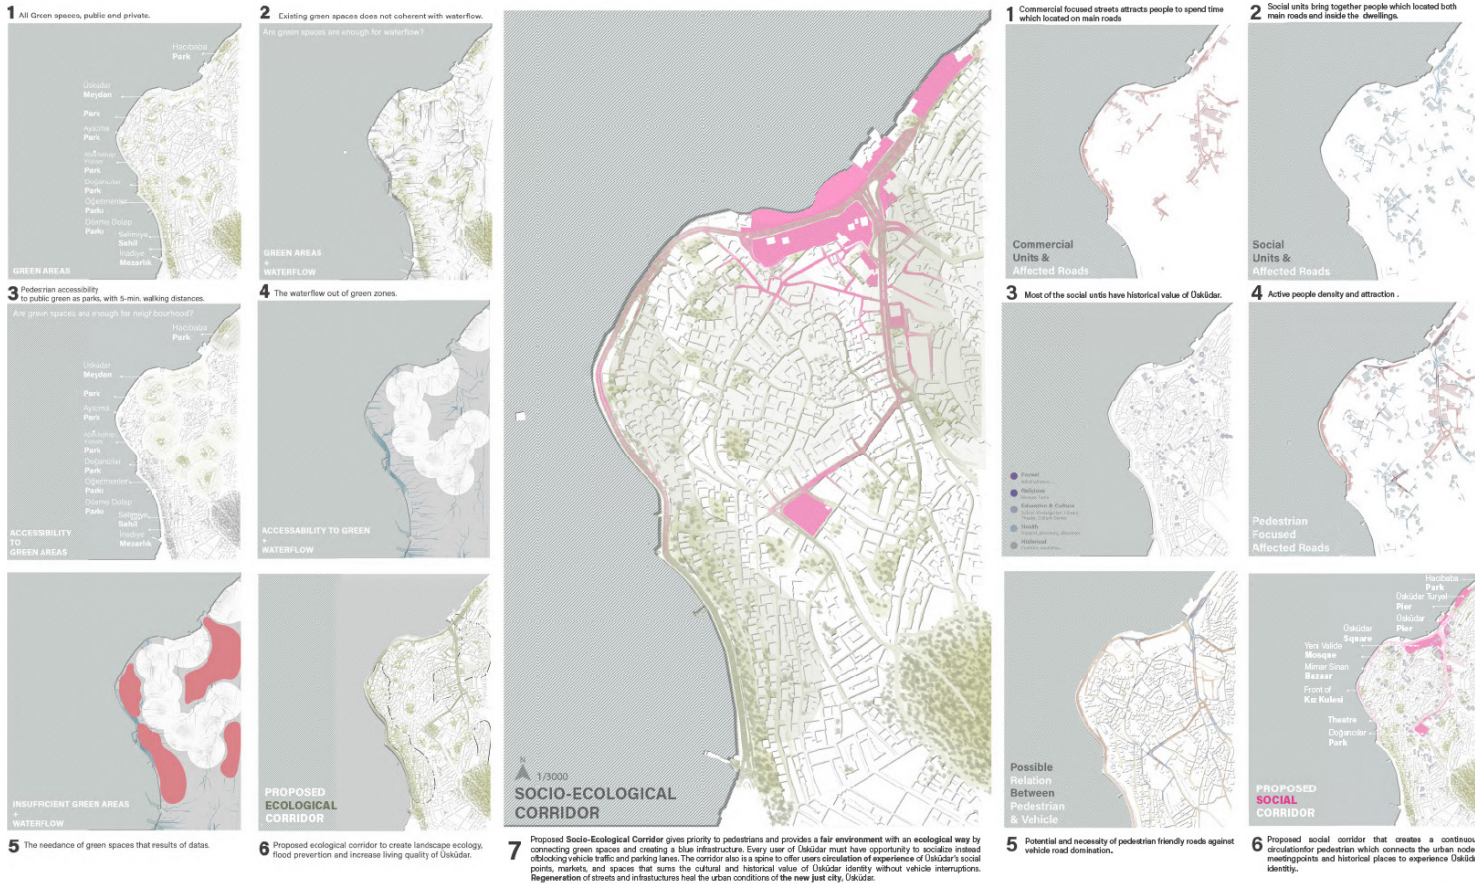

CONSIDERING EXISTING

Proposed plants based on existing and important for urban identity. Also plants that prosed for bioswales which are wetlands.

FORMATION OF SOCIO-ECOLOGICAL CORRIDOR

to create social democracy in Üsküdar

Urban justice ensures that every user has the opportunity to use the city safely. It begins when users can easily socialize, engage with the city by understanding its urban identity, and see a reflection of themselves within it. To achieve this, ecological and pedestrian-oriented design decisions must be made to create a pedestrian-friendly, human-scale district. User participation should also be integrated into the design process. The needs of users shape the city. Spontaneous motivations and actions inspire people to transform urban areas. One issue in the city is the lack of connectivity between residential areas and the coast due to traffic routes.

Landscape Ecology in Üsküdar
Green & Blue Infrastructure
When discussing urban life, it's essential to evaluate whether the city has a healthy ecological infrastructure. The areas of green space amidst the concrete urban fabric are directly proportional to the quality of life in the city. There should be accessible green

socializing areas in every residential neighborhood. All green spaces—whether in medians, parks, or squares—should work together as part of a unified ecological system. The amount of green space available to users in Üsküdar is quite low and insufficient compared to the prevalence of concrete surfaces.

Flood Risk
Üsküdar is a coastal district in Istanbul with very dynamic topography. Rainwater tends to accumulate on certain sloped streets, and due to the inadequacy of Üsküdar's blue infrastructure, flooding occurs as a result.

Formation of Proposed Socio-Ecological Corridor
Key Concept
The proposed Socio-Ecological Corridor prioritizes pedestrians and creates a fair and ecological environment by connecting green spaces and establishing blue infrastructure. Every user of Üsküdar should have the opportunity to socialize, with vehicles and parking

lanes no longer obstructing access. The corridor acts as a spine, offering users a journey through Üsküdar's social spaces, markets, and places that embody the cultural and historical identity of the district, all without vehicle interference. The regeneration of streets and infrastructure will improve the urban conditions of a new, more just city in Üsküdar. The corridor is defined by both social and ecological factors: the social corridor is determined by land use and active circulation density, while the ecological corridor is defined by existing green spaces and water flow analysis.

Users of Üsküdar
To create a just city, every user must have the opportunity to walk, pass through, and spend time in the proposed design. Transit users can now wait and spend time in commercial or recreational areas within the transportation zone. Tourists can walk along historical routes and the coastline. Residents and workers in Üsküdar can access the socio-ecological corridor, and fishermen have designated areas along the coast.

Design Strategies in the Proposed Context of the Socio-Ecological Corridor
For a pedestrian-oriented district, all obstacles that disrupt pedestrian movement have been replaced with more functional, human-scale design solutions. Vehicle lanes have been reduced, and the minibus station removed to prioritize active traffic and reduce parking. Green patches have been redesigned to accommodate continuous pedestrian circulation. Randomly placed green pots and commercial businesses that block the historical identity of the coastline and the Şemsipaşa Complex have been removed. Adequate parking spaces have been provided, making parking lanes unnecessary. The proposed pedestrian circulation creates historical routes for every user of Üsküdar. Rather than merely being a transit point, Üsküdar transforms into a place to spend time, highlighting its important historical and cultural landmarks. The green areas along the sidewalks separate pedestrians from the view and noise of the road, allowing them to focus on experiencing the essence of Üsküdar.

DESIGN STRATEGIES

Road Sections of the Socio-Ecological Corridor

1/50

ISTANBUL TECHNICAL UNIVERSITY
LANDSCAPE DESIGN III | 2020-2021 FINAL

Harem St.

With the pedestrian-friendly design of Üsküdar, the vehicle lane reduced to 2 lanes, the bioswales created on the sidewalks and same species of trees, the ecological vegetated tram line and the bicycle path and the mobile commercial units proposed to the coastal walkway, giving everyone opportunities, emphasizing the coastline that provides Üsküdar's identity and It is aimed to make it walkable in anytime.

1/100 Section

Hakimiyet-i Milliye St.

For the continuity and integrity of the socioecological corridor, the historical Hakimiyet-i Milliye street, which is the commercial heart of the city, has been reduced to two lanes, while the bioswale bands and the tram line continue, the vehicle road has been reduced to two lanes, a more equitable environment for more users by allowing more space for pedestrians. is targeted.

New Form of Life

Zeynep Berfu Yılmaz

“New Form of Life” was produced within the scope of Landscape Design IV carried out by Prof. Dr. Gülşen Aytaç and Res. Assist. Gizem Aluçlu under the title “Water & The City: Ayamama Corridor” in the fall semester of 2021-2022.

Ayamama Stream, the focus and location of this project, is situated on the European side of Istanbul. It originates from a spring in the eastern part of the Başakşehir district. The stream flows through the districts of Bağcılar and Bahçelievler before emptying into the Marmara Sea within the borders of Bakırköy. Historical sources indicate that Ayamama Stream was once surrounded by fertile agricultural land. It had many branches from its source to its mouth, serving as an important water source for the surrounding orchards, gardens, and farms.

The stream was also home to several historical bridges and sacred springs dating back to the Byzantine period. However, with the surge of migration to Istanbul after the 1950s, illegal construction

began to encroach upon the area around the stream. Poor urban planning led to the establishment of numerous factories and industrial facilities near the stream, resulting in significant pollution. As surrounding villages and illegal settlements evolved into the modern districts we see today, the stream’s natural course was altered. The D100 and TEM highways, two of Istanbul’s most important roads, now pass through the region. Most of the stream was forced underground, and its bed was narrowed.

The goal of this project is to restore the stream to a condition where it no longer poses a danger to the surrounding residents, while also creating a vibrant living space that benefits both people and nature.

1 Water Management

2 Identification of Flood Zones

“A New Life Form in Ayamama” is based on three main principles: the first is “Everything Starts with Soil,” the second is “Safety is Important,” and the third is “New Places & New Routines.”

1. Everything Starts with Soil

The first step was to prioritize the soil, allowing Ayamama Stream to flow over a permeable surface instead of the previous concrete channel. The streambed was also widened in certain areas to improve the flow rate. The vegetation on the islets formed along the stream became a crucial element in both purifying the water and sustaining the surrounding ecosystem.

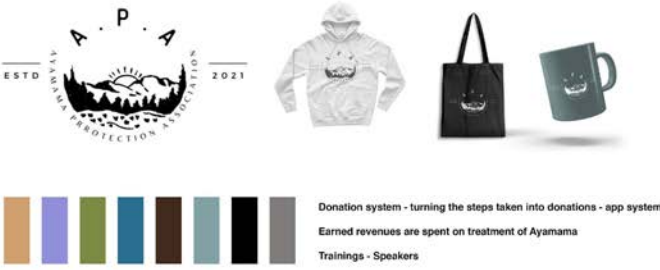

2.Safety is Important

By reviewing the 100-year-old flood map of the creek, which had previously flooded during heavy rainfall, we identified areas at risk. These areas were cleared and redesigned to ensure they would pose no harm in the event of future floods. These areas are primarily sloped, vegetated regions, but they can continue to be used even during floods.

3 New Places & Social Awareness

To create areas that can be used by people living in the new areas created by the displacement of risky structures in flood areas.

At the same time, by activating the “Ayamama Protection Association” (A.P.A) which will act together with the associations in the area, to raise awareness and involve them in Ayamama's new life form.

ACTIVITY CALENDAR

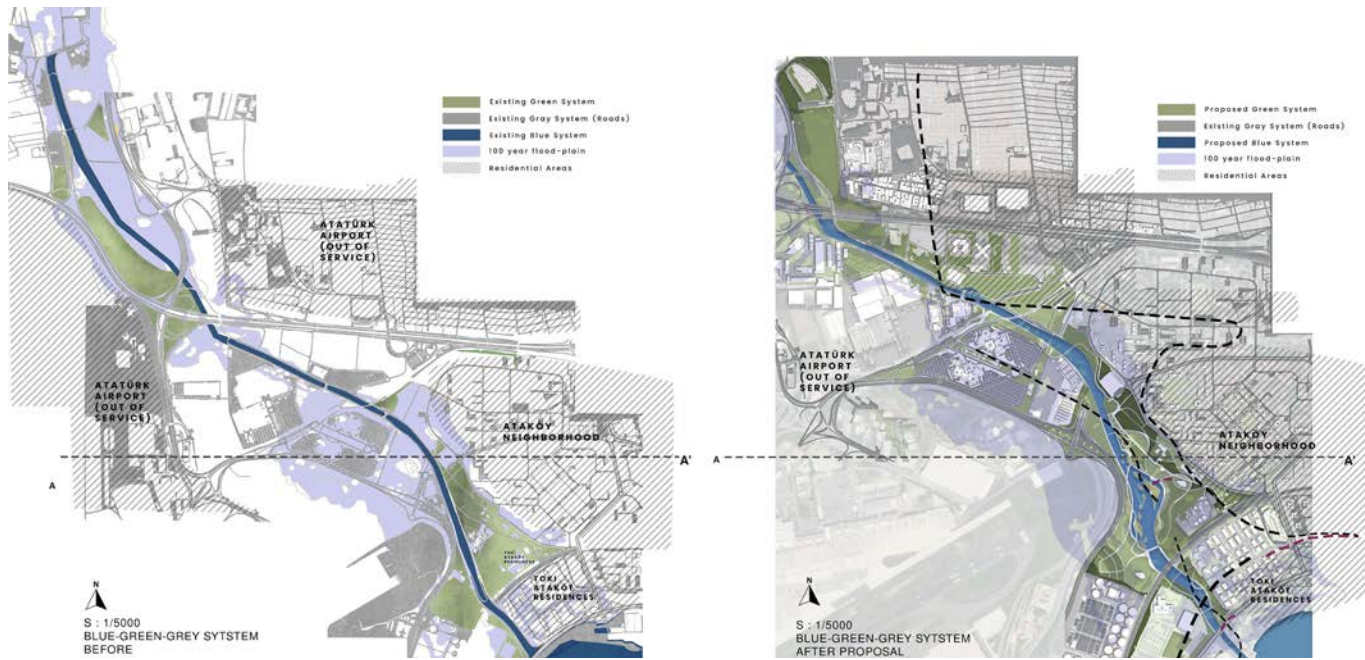

J	F	M	A	M	J	J	A	S	O	N	D
Ice skating											Ice skating
Indoor activities (Seminars, speakers etc.)		Outdoor activities	Planting	Connection with water	Boat trips	Fruit Collecting		Outdoor activities			
Indoor sales (Donations)		Running, cycling						Back to School Activities for Kids			New Year Celebrations and Market
		Outdoor sales for donations						Festivals			
								Birthday celebrations			

3.New Places & New Routines

Due to the pollution, poor usage, and unpleasant odor of the Ayamama Stream, there were no accessible spaces for the surrounding community. Once the creek was cleaned and restored to its natural bed, new walking paths, jogging tracks, sports fields, bridges, and functional open spaces were created, providing areas for daily use.

Additionally, new spaces were developed by relocating at-risk structures from flood zones. These areas will serve the local community, providing recreational and functional spaces. To further engage the community, the “Ayamama Protection Association” (A.P.A.) was established. This association, in collaboration with local groups, aims to raise awareness and involve residents in the stream’s revitalization.

The A.P.A. includes a donation system where actions, like walking, are converted into donations via a mobile app. Revenue generated from A.P.A.-branded products and activities is used for the maintenance and improvement of the waste treatment plant and Ayamama Stream. Seasonal activities are also held, including ice skating in winter, boat trips in summer, fruit picking, festivals, and walks.

There are six main areas in the new living space created along Ayamama Creek:

1. Raingarden, Sandy Area, and Open Space
2. A.P.A. Building and Bridge to the Opposite Island
3. Sports Field for the Ataköy Neighborhood, Walking and Jogging Paths
4. Advanced Biological Wastewater Treatment Center
5. Buffer Zone and Garden Along the Roadside with a Steep Slope, Featuring a Walking Path with Access to the Opposite Island
6. A.P.A.'s Second Building and Functional Space
7. Multi-purpose Wooden Deck and Floating Platform on the Opposite Shore

Permeable materials were used throughout the park's construction. Permeable concrete and andesite stone were used for the pedestrian paths. For lighting, both tall fixtures and smaller ground-level lights were installed for security purposes. Seating areas were provided for relaxation, and open spaces were created to allow people to feel free and comfortable.

In terms of planting, *Acer negundo*, *Acacia dealbata*, and *Tamarix parviflora* were used along pedestrian pathways. To create a grove-like atmosphere in the urban forest, *Cedrus atlantica* and *Populus alba* were selected. Shrubs such as *Pittosporum tobira* "nana" and *Cornus mas* were also used, along with colorful and striking plants like *Digitalis purpurea*, *Echinacea atropurpurea*, *Lavandula angustifolia*, and *Euryops pectinatus*, which not only add visual appeal but also emit pleasant scents along the paths. Aquatic plants, including *Juncus effusus*, *Pontederia cordata*, *Typha latifolia*, *Eichhornia crassipes*, and *Nymphaea colorata*, were incorporated to create a water source for purification, aesthetic enhancement, and to support the surrounding ecosystem. As a result, Ayamama Stream and its surrounding areas have been transformed into a vibrant space where people can once again visit for recreational and tourist activities. This restoration has been achieved by cleaning the stream, ensuring the sustainability of the surrounding environment, and integrating thoughtful planting to support the ecosystem.

Re-viewing Ayamama

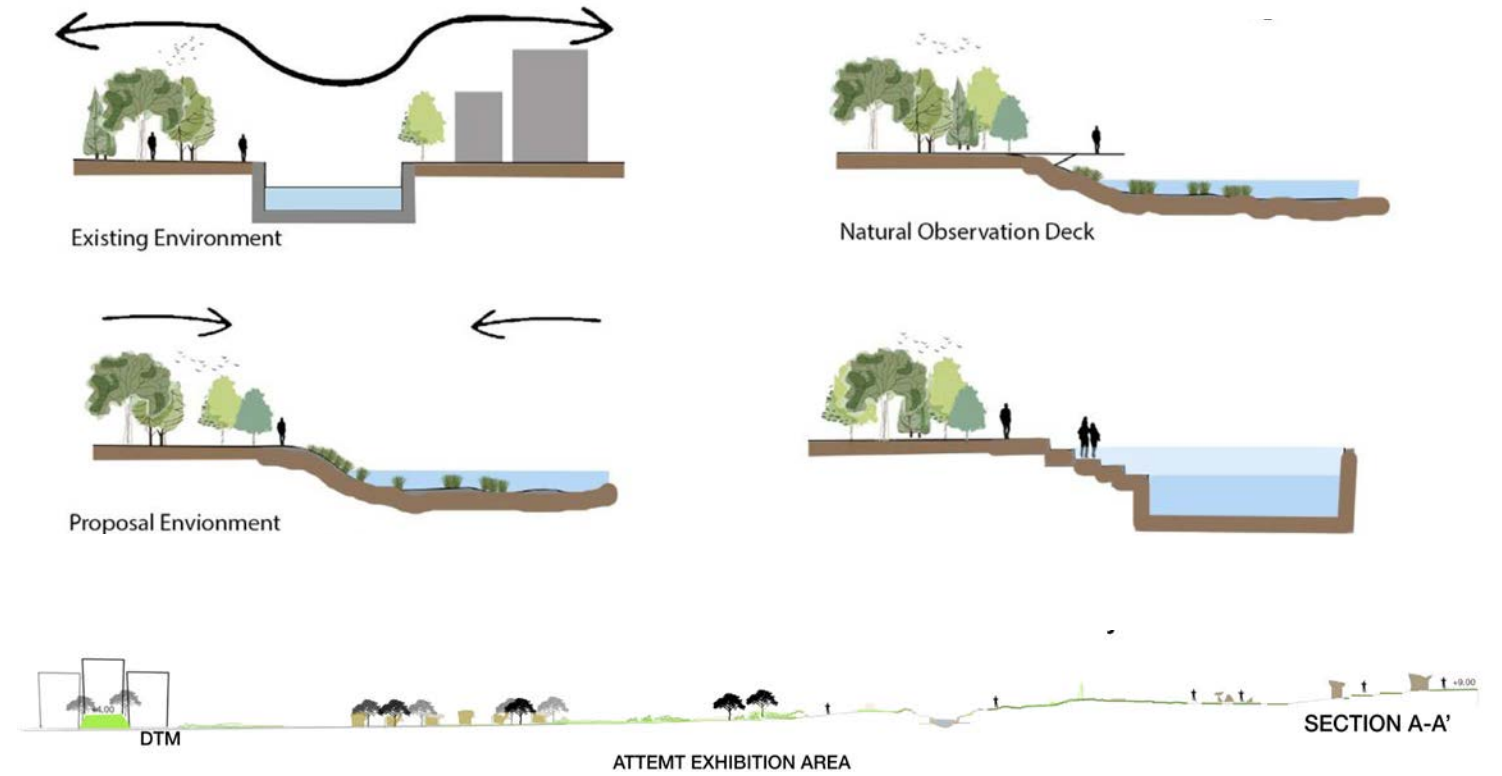

Beyzanur Seferi

"Re-viewing Ayamama" was produced within the scope of Landscape Design IV carried out by Prof. Dr. Gülşen Aytaç and Res. Assist. Gizem Aluçlu under the title "Water & The City: Ayamama Corridor" in the fall semester of 2021-2022.

The aim of this project is to establish an ecological balance by creating a green corridor around Ayamama Stream, reconnecting the creek with the people, integrating it with nature, and minimizing the risk of flooding. Located in the heart of Istanbul, the stream passes through six different districts and is surrounded by numerous workplaces, residential areas, and industrial facilities. Its strategic importance is further emphasized by its proximity to a harbor, its outlet into the Marmara Sea, and its intersection with key transportation routes.

To minimize flood risk, the water flow directions were carefully mapped, and rain gardens were proposed for areas at lower elevations. Sports facilities, workshops, and children's playgrounds were located near residential areas and the stream to encourage interaction with the creek. The landscape was enriched with a variety of deciduous and evergreen trees, adding seasonal variation, while water-purifying plants helped improve the quality of the stream water.

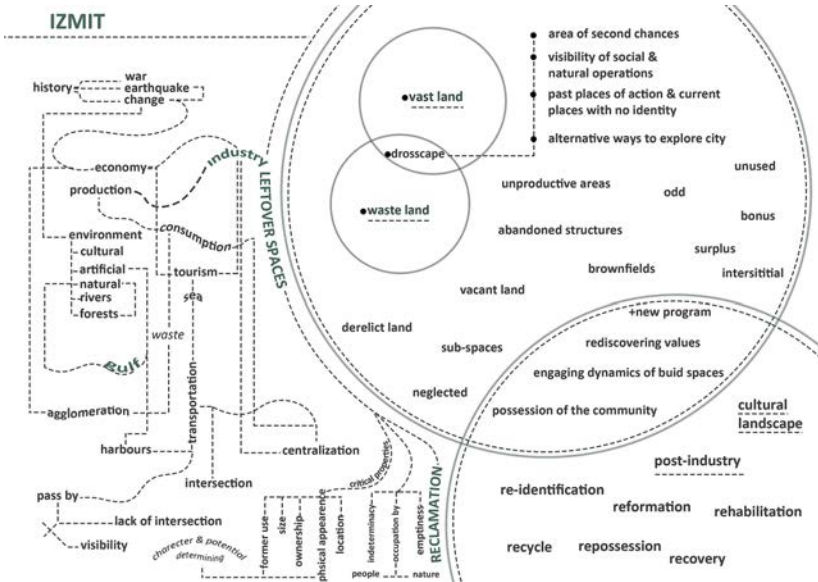

Re-Incarnation

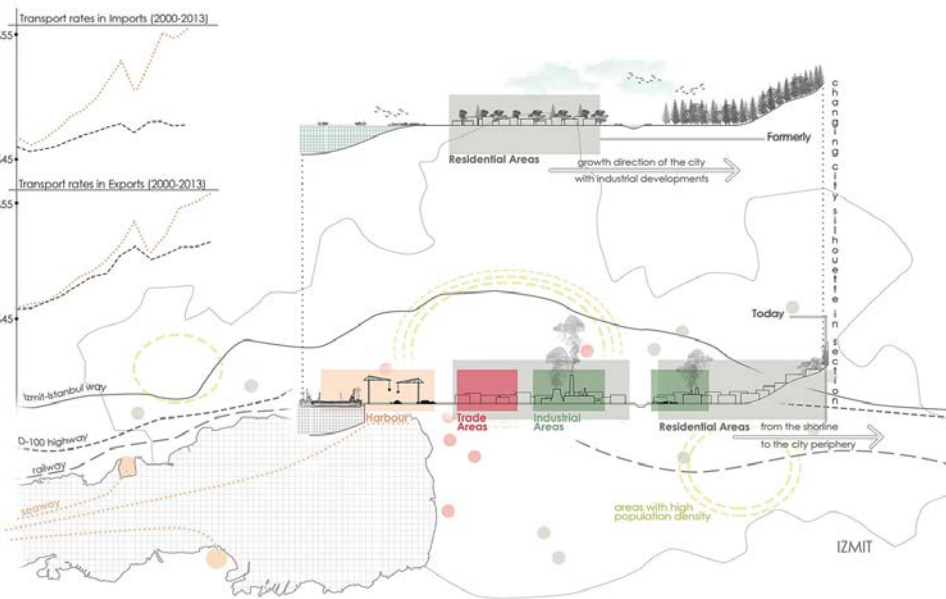

İrem Nur Yener, Merve Dilara Ezer, Melisa Albayrak, Ayşe Nur Azbay

“Re-Incarnation” was produced within the scope of Landscape Design IV carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Nergis Aşar under the title “Reclaiming Landscape: Post-Industrial Scenarios for Gulf of İzmit” in the fall semester of 2021-2022.

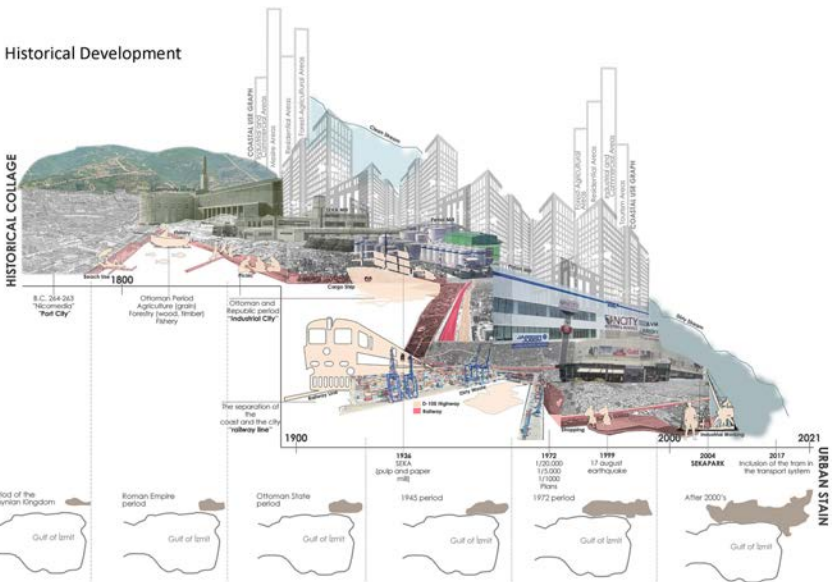

How will they reincarnate?
With considering the shoreline as a ‘second chance’ area and considering these areas as ‘an alternative way of exploring the city,’ ‘making social and natural situations visible’ in the area.

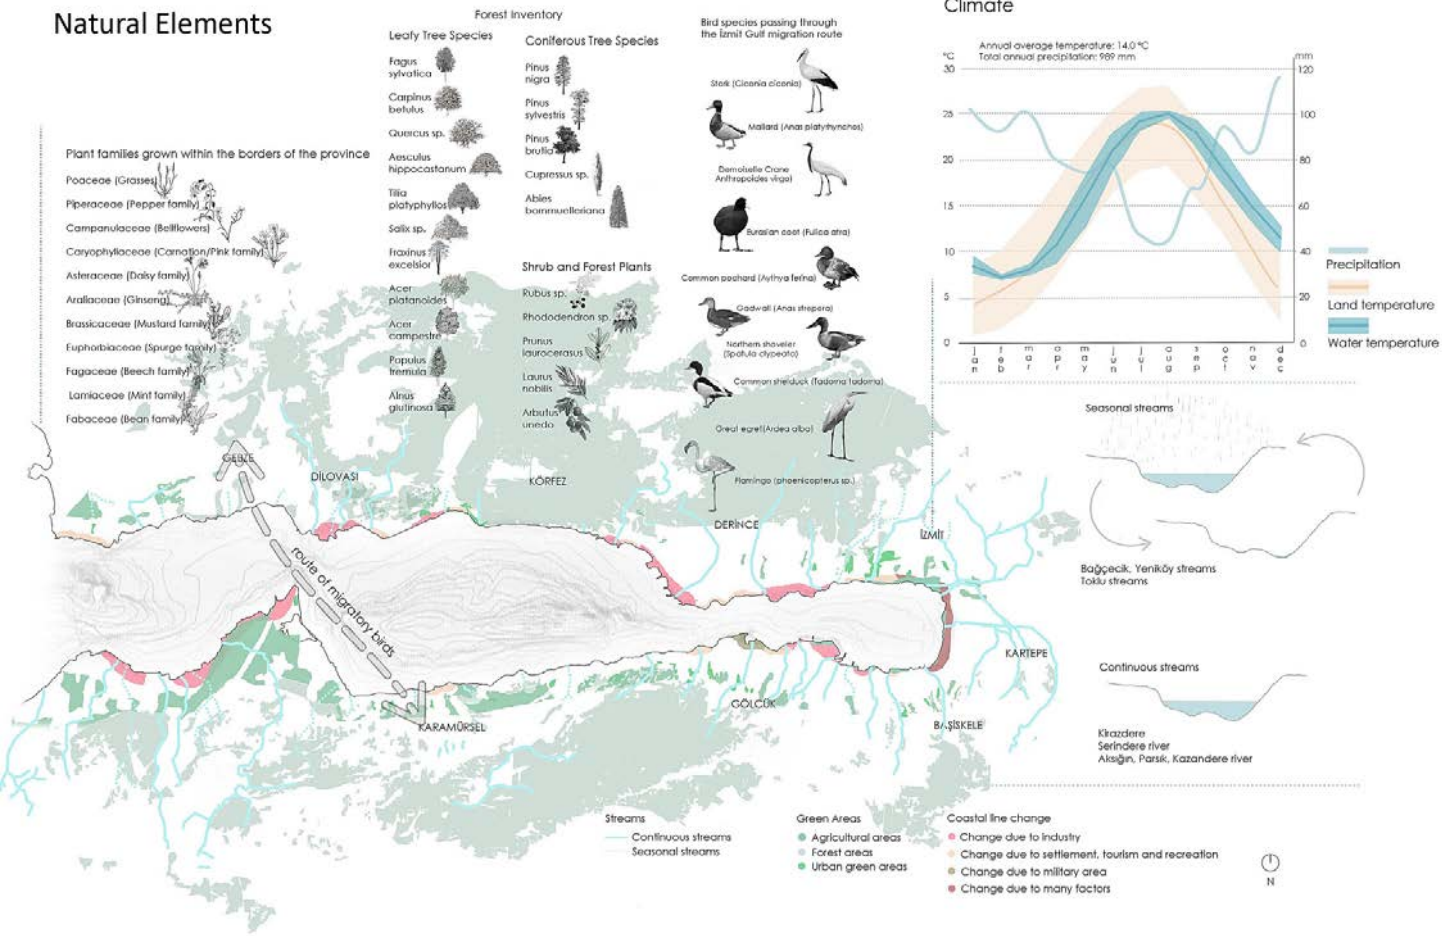

About İzmit

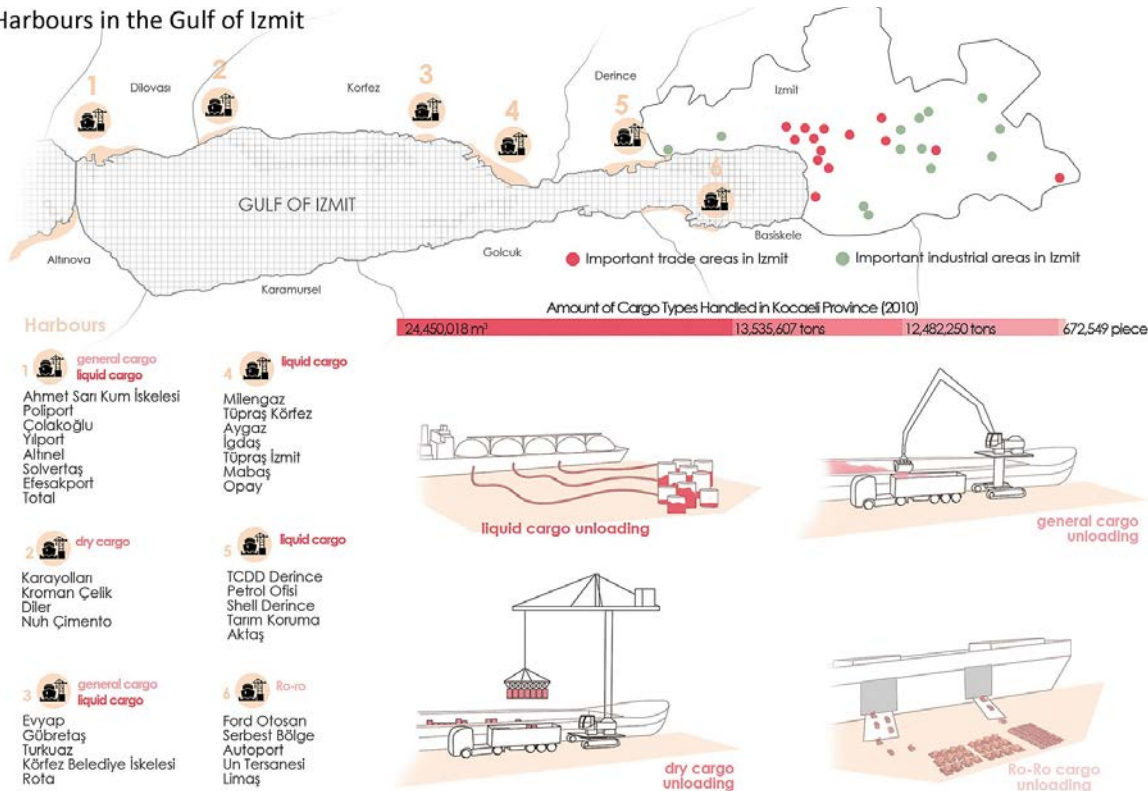

Historical Development

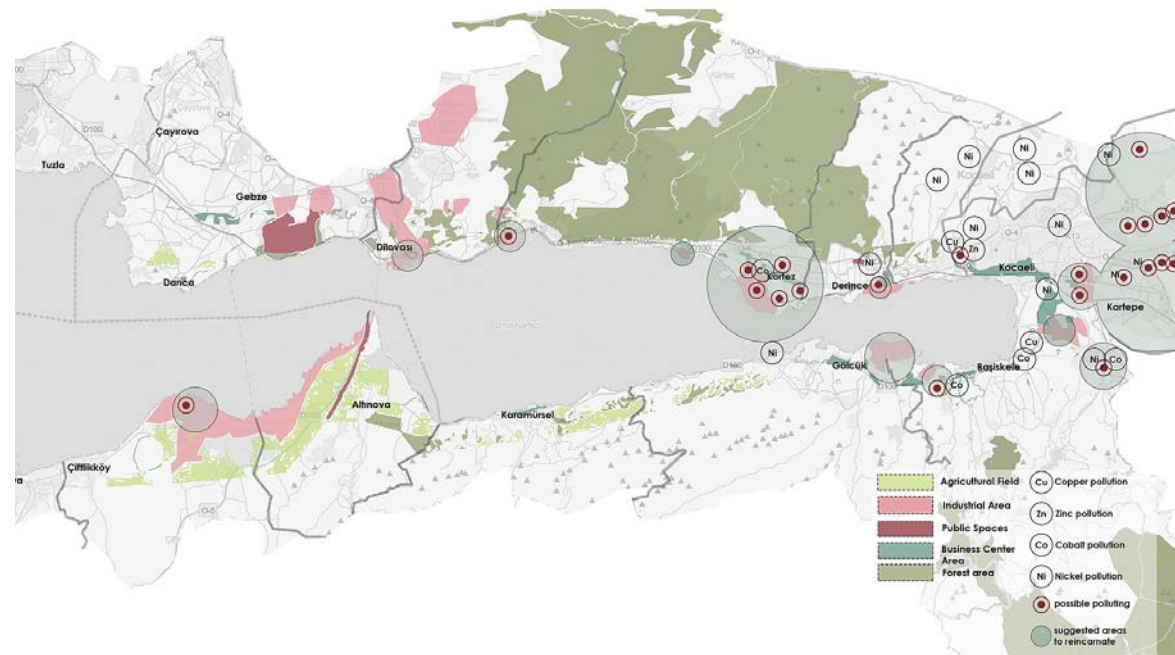

Natural Elements

Harbours in the Gulf of Izmit

Areas Whose Possible Function Will Be Changed in The Future Scenario **Primarily**

2021-2022 Fall

Strengths

It is located in the Marmara Region, which is rich in biodiversity.

- Having a strong geographical structure and being a natural harbor.

Being a transit point between the Black Sea and the Mediterranean in sea transportation.

- Being in the middle of the important metropolitan cities which is İstanbul and Bursa

It has the most important transportation network in the country. Being the focal and intersection point of the İstanbul-İzmir-Ankara triangle.

Having a very strong and developed industry.

High potential of aquaculture.

High tourism potential

Weaknesses

The limited habitable area due to the fact that the already narrow habitable areas of the north of the Körfez have been converted to a large extent.

- Lack of storage space in ports.

The negative effects of the earthquake have not been completely eliminated.

Threats

Being in the first degree earthquake zone and having active fault lines.

There is an environmental pollution caused and will be caused by intensive industry.

Having a heavy transportation load due to being the focal point.

Wetland are heavily threatened by urban development and industrial pollutants and are on the verge of extinction.

LD IV / Reclaiming Landscape: Post-Industrial Scenarios for Gulf of Izmit

Goal 1: ECONOMICAL

The future scenario aims to encourage new economic activities that are compatible with technology and open to the public in areas being revitalized. These areas will address the negative impact of past economic activities, which damaged the existing ecology, social life, and the city's coastal identity.

- Str 1.1: Revitalize the economic activities that define Izmit's identity, which have been suppressed by industry, in line with future technological advancements.
- Str 1.2: Achieve a balance between the city's existence and industrial areas through various measures.
- Str 1.3: Redesign idle areas to be used for workshops and studios.
- Str 1.4: Make the production and projects in the proposed new economic zones open to the public, fostering cooperation through information-sharing systems.

Goal 2: ECOLOGICAL

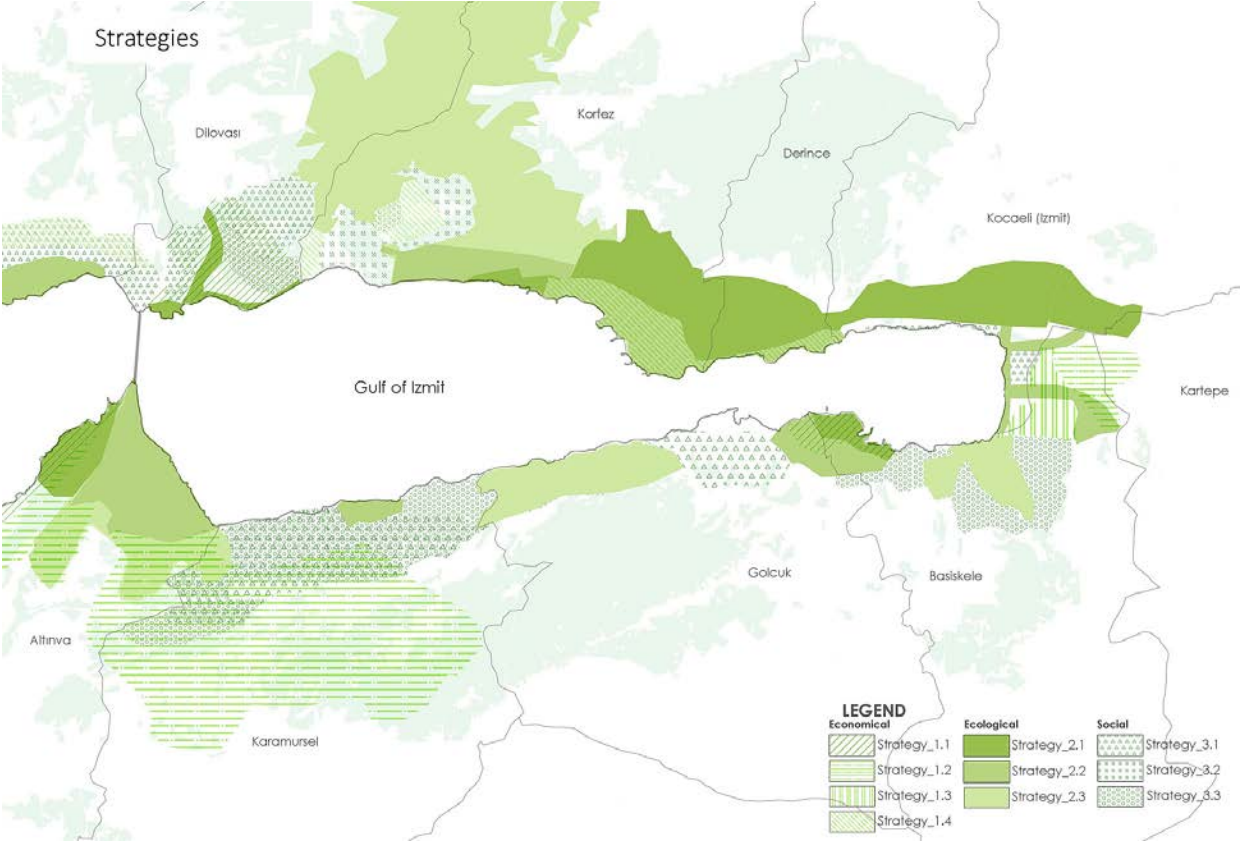

The goal is to preserve the ecological identity of the city by safeguarding its current ecological values and protecting these areas from the harmful effects of industry.

- Str 2.1: Implement waste planning and management strategies to ensure ecological sustainability and prevent waste accumulation.
- Str 2.2: Support the diversity of flora and fauna in these areas by conducting breeding programs and managing the site in harmony with the natural cycle.
- Str 2.3: Foster ecological sociality by raising public awareness of ecological globalization through new programs.

Goal 3: SOCIAL

The objective is to strengthen social relationships among people and between people and the city.

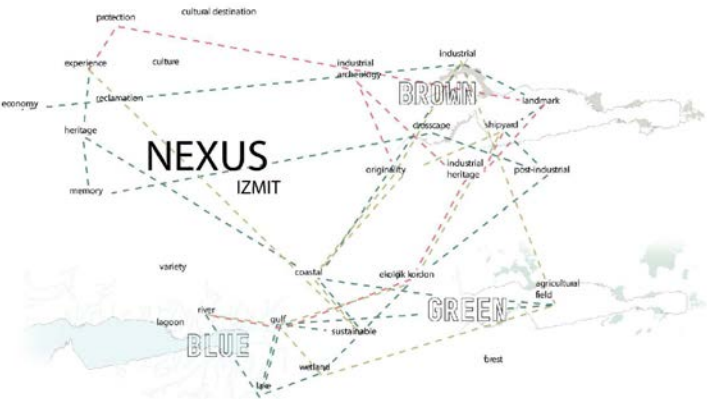

- Str 3.1: Create open, outward-facing spaces that enhance social cohesion and promote interaction between citizens, carrying this social identity into public spaces rather than closed ones.
- Str 3.2: Promote abstract productions on social relations through institutions such as NGOs by relocating social facilities to open spaces.
- Str 3.3: Strengthen the social connections between urban and rural areas to achieve balance between the two environments.

Nexus

Elif Koç, Baran Yeşilgül, Kübranur Akkabak, Melike Cemre Okuyucu

"Nexus" was produced within the scope of Landscape Design IV carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Nergis Aşar under the title "Reclaiming Landscape: Post-Industrial Scenarios for Gulf of Izmit" in the fall semester of 2021-2022.

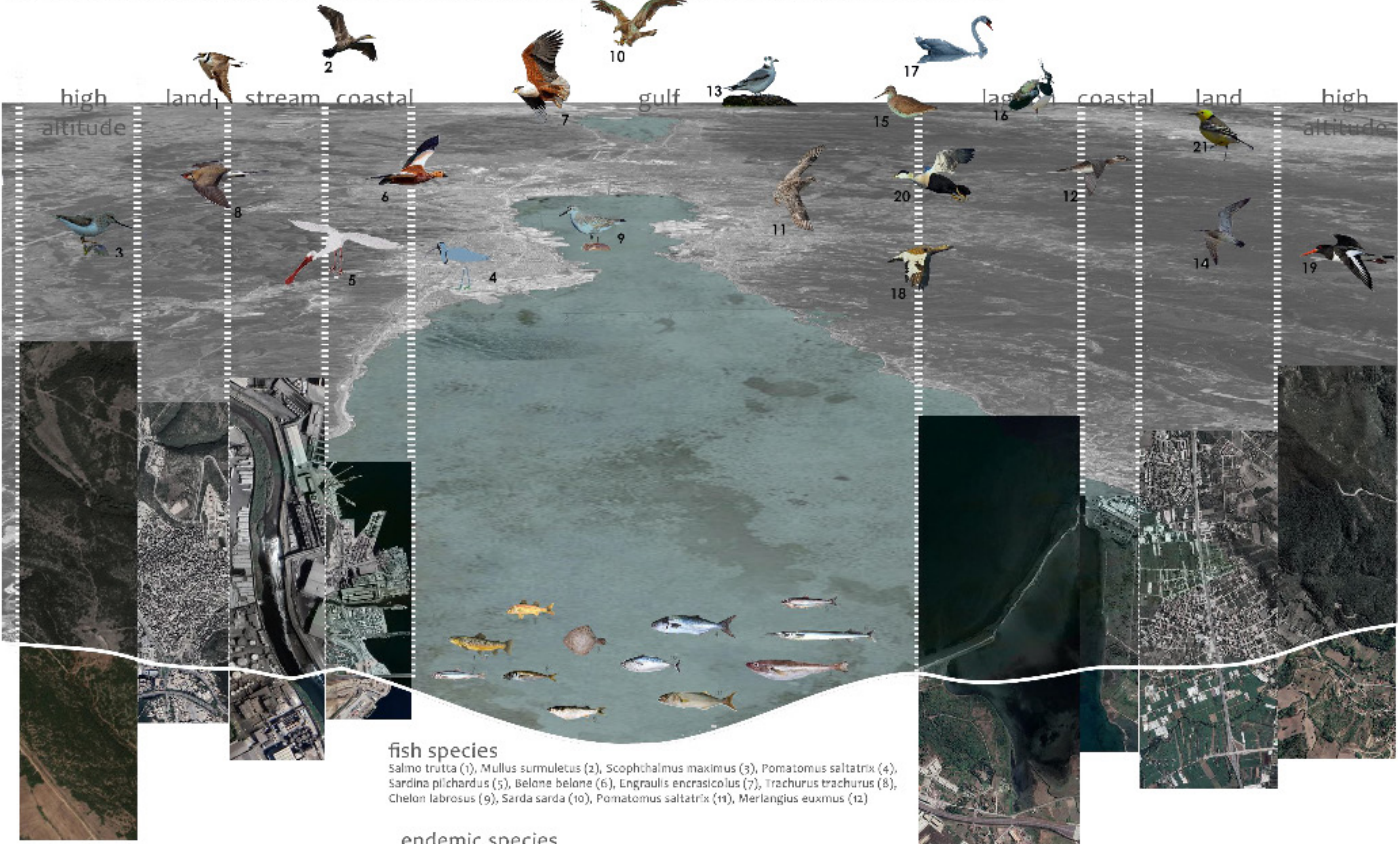

Development:
The transformation of areas currently idle and occupied by industrial zones. Regional development efforts will focus on strengthening the economic and social infrastructure within these transformed areas.

Principles:
New bay model
Global and local integration
Strategic planning
Sustainable design
New collaborations and decision-making mechanisms
Multi-sector city management

There are various types of coastal usage in the Gulf of Izmit. At different points along the shoreline, industrial areas such as shipyards and ports dominate. Moving from these areas towards the city, agriculture, residential areas, and forests follow in succession. Highways run through these regions at various points. The area is caught between the highway and the shipyards, particularly around the lagoon region, which holds significant ecological value on the coast. The division of the coastline by industrial zones and private properties disrupts the continuity of the coast, creating a barrier that negatively impacts human-water relationships and the gulf's ecosystem.

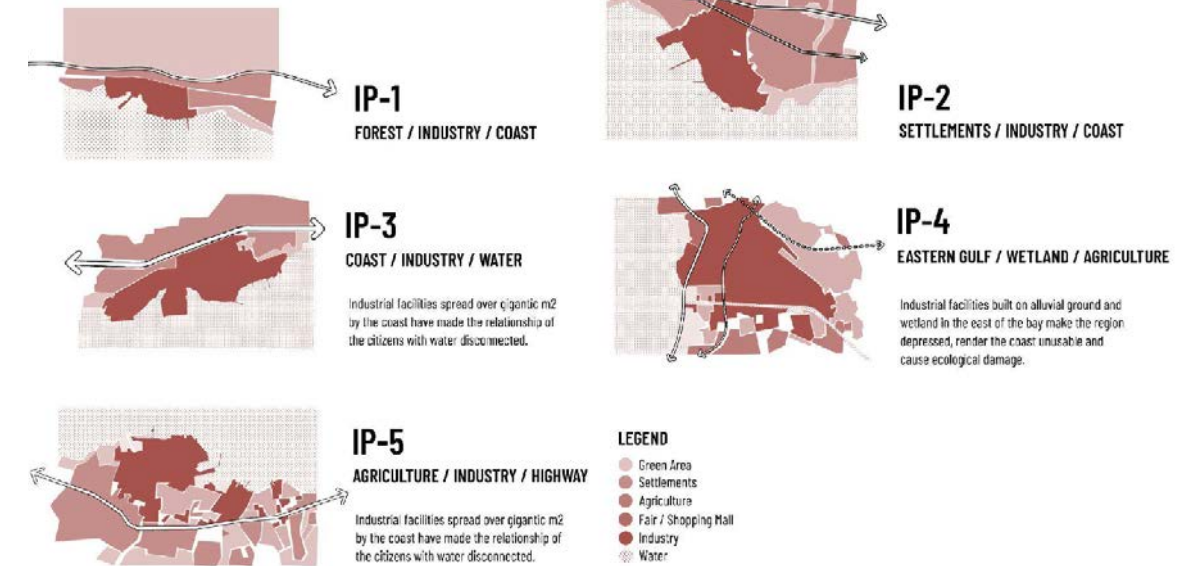

Public Campus

Begüm Beste Ege, Nuran Kul, Zehra Betül Doğan, Zeynep Aydın

"Public Campus" was produced within the scope of Landscape Design IV carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Nergis Aşar under the title "Reclaiming Landscape: Post-Industrial Scenarios for Gulf of Izmit" in the fall semester of 2021-2022.

Stanchion
There is a high risk of extinction in the wild. 30% decrease in population in the last 10 years. It is seen intermittently in Winter in Zand Wetland.

Its extinction is endangered in nature in the near future. It lives in large reeds in fresh and brackish waters. It can always be seen in Iamit Wetland.

B3 - Lapwing
There is a high risk of extinction in the wild. A decrease of 30% in its population in the last 10 years. It is under protection on a European scale. It is seen in the Izmit wetland.

03 Great Sandpiper
It is under protection on a global scale.
Its extinction is under threat in nature in the near future. Migration time is observed in Janis Wetland.

As terrestrial species and assemblages of the same species; There are reptiles, birds, mammals.

GÖLCÜK ZONE

Since the Gölcük region has a settlement character close to the coast, it is suggested that the local population be considered the primary users of this area. The construction of public open and closed spaces that establish an active relationship with the coast is recommended. Due to the region's potential to interact with basic educational institutions, it is proposed that the area should accommodate information-sharing activities, such as a membership system, at various venues. It is also suggested to create ponds along the large rivers flowing into the eastern shore of the Gulf, in sections suitable for the geomorphological structure. Because the region is located on permeable areas, which are inland due to changes in sea level, these should be protected and designed as disaster assembly areas.

HERSEK ZONE

An important part of the ecological integrity of the Gulf of İzmit is the preservation of the natural character of the Hersek region. Therefore, in the future scenario, maintaining the natural characteristics of Hersek provides opportunities for people to experience nature within a campus setting, and for learning through observation.

EASTERN GULF ZONE

This area displays the most intense geographical accumulation within the bay. The region bears a significant burden, as it was the first settlement in İzmit, the initial area of industrial development, and is currently the city's commercial center, hosting numerous functions. Given the region's terrain, coastal environment, and settlements located on an alluvial plain, it is susceptible to flood risks. The wetlands along the coastal part of the region have been partially drained and filled, resulting in a significant loss of the city's oxygen supply. It is proposed to revitalize the destroyed wetland areas to restore natural spaces, allowing for accumulation and mitigating the region's ground depression. Additionally, a large portion of the auto industry, which occupies significant land in the region, is recommended to be removed. It is envisioned that large-scale structures, such as shopping malls and exhibition centers located on the coast, will be integrated with open public spaces.

SEKA ZONE

The SEKA Zone houses the remains of the SEKA paper factory, one of the first factories in İzmit. To preserve the industrial and architectural value of the ruins, it is suggested that they remain in the area. Open spaces that can interact with users will be designed,

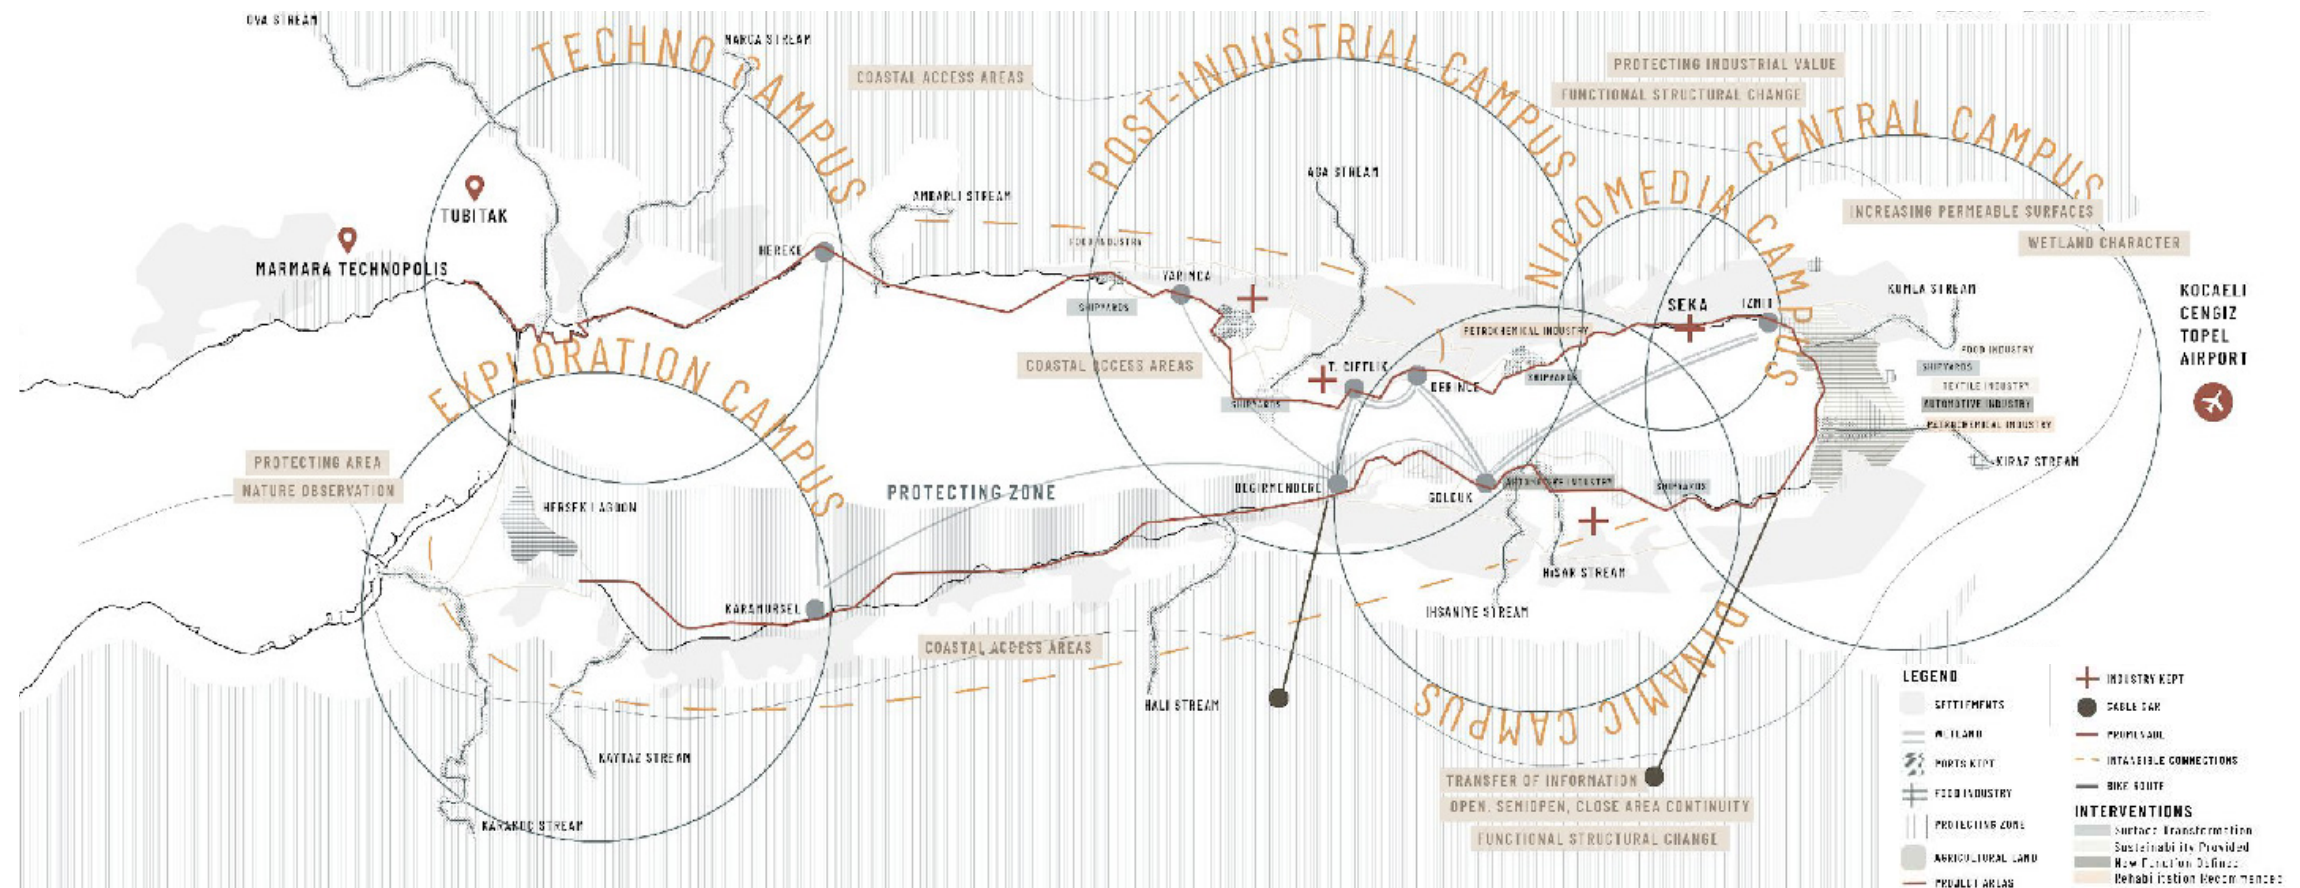

and new activity areas will be created by utilizing the large surface area available in the region.

KÖRFEZ ZONE

The Körfez Zone is one of the oldest settlements in İzmit and is named after the famous Hereke carpet, which is a significant cultural asset of the region. This area, constrained by mountains and the sea, is not ideal for large-scale settlement. Since it is anticipated that less physical space will be needed in the education sector in the future, it is proposed to eliminate congestion by removing some structures within the educational institutions.

DERİNCE ZONE

Derince, which takes its name from the deepest part of the coast, is a highly functional area where railway, sea, and land transportation networks intersect. It contains industrial, military, and port areas. Over time, the coast has been filled, and the industrial zones occupy the coastline the most continuously. In the past, the industrial area extended inland, but as the plan evolved, it was transformed into a residential area. According to the future scenario, it is proposed to create coastal access areas by reducing the industrial zone that heavily occupies the coastline.

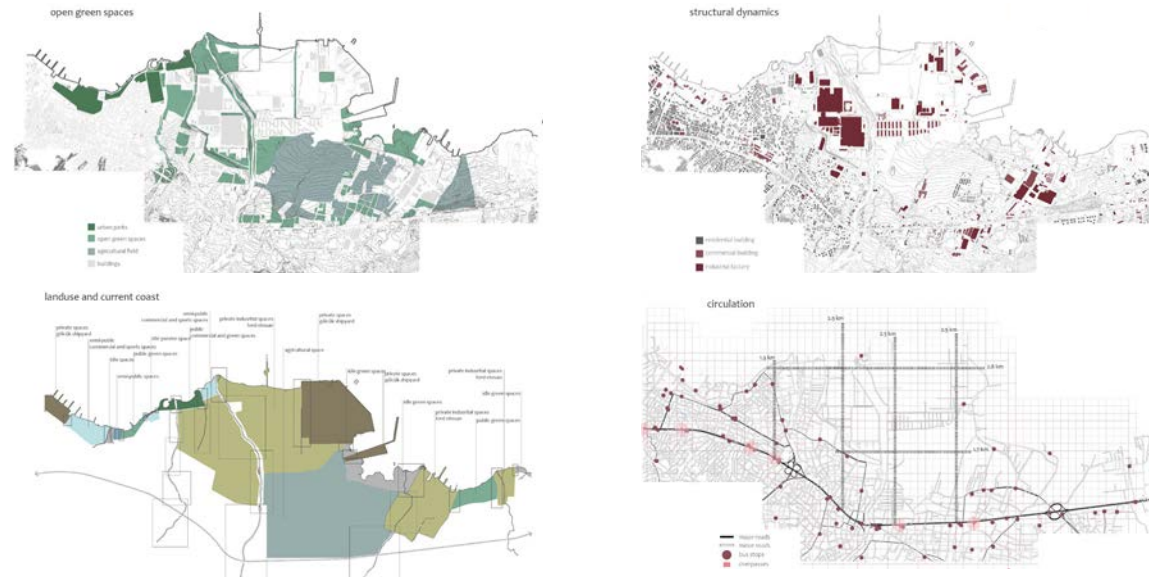

Nexus Gölcük

Kübranur Akkabak

"Nexus Gölcük" was produced within the scope of Landscape Design IV carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Nergis Aşar under the title ""Reclaiming Landscape: Post-Industrial Scenarios for Gulf of İzmit" in the fall semester of 2021-2022.

The design proposal features a coastal dune structure, which is a key component of delta habitats. This area includes a variety of plant life such as aquatic vegetation, newly emergent plants, reeds, wet grasses, dry grasses, and meadows along the coast surrounding Hisar Stream. Agricultural areas are integrated within this ecosystem, connecting the coast with surrounding land. The design approach followed a process-based model, ensuring a holistic and dynamic setup. Additionally, the flood risk in Gölcük has been carefully considered, with plans showing how land usage will adapt to varying water levels.

The Ford auto industry factories, located in the coastal region of Gölcük, represent one of the largest commercial production hubs in the area. However, the region is situated along the northern Anatolian fault line, which poses an earthquake risk. Additionally, the coastline has been filled in over time and is now at risk of submersion due to rising sea levels caused by climate change. The key natural element contributing to the blue-green system of the pond, frequently visited by birds, is the stream. Unfortunately, the industrial facilities situated near the stream contribute to its pollution, further exacerbating the environmental challenges.

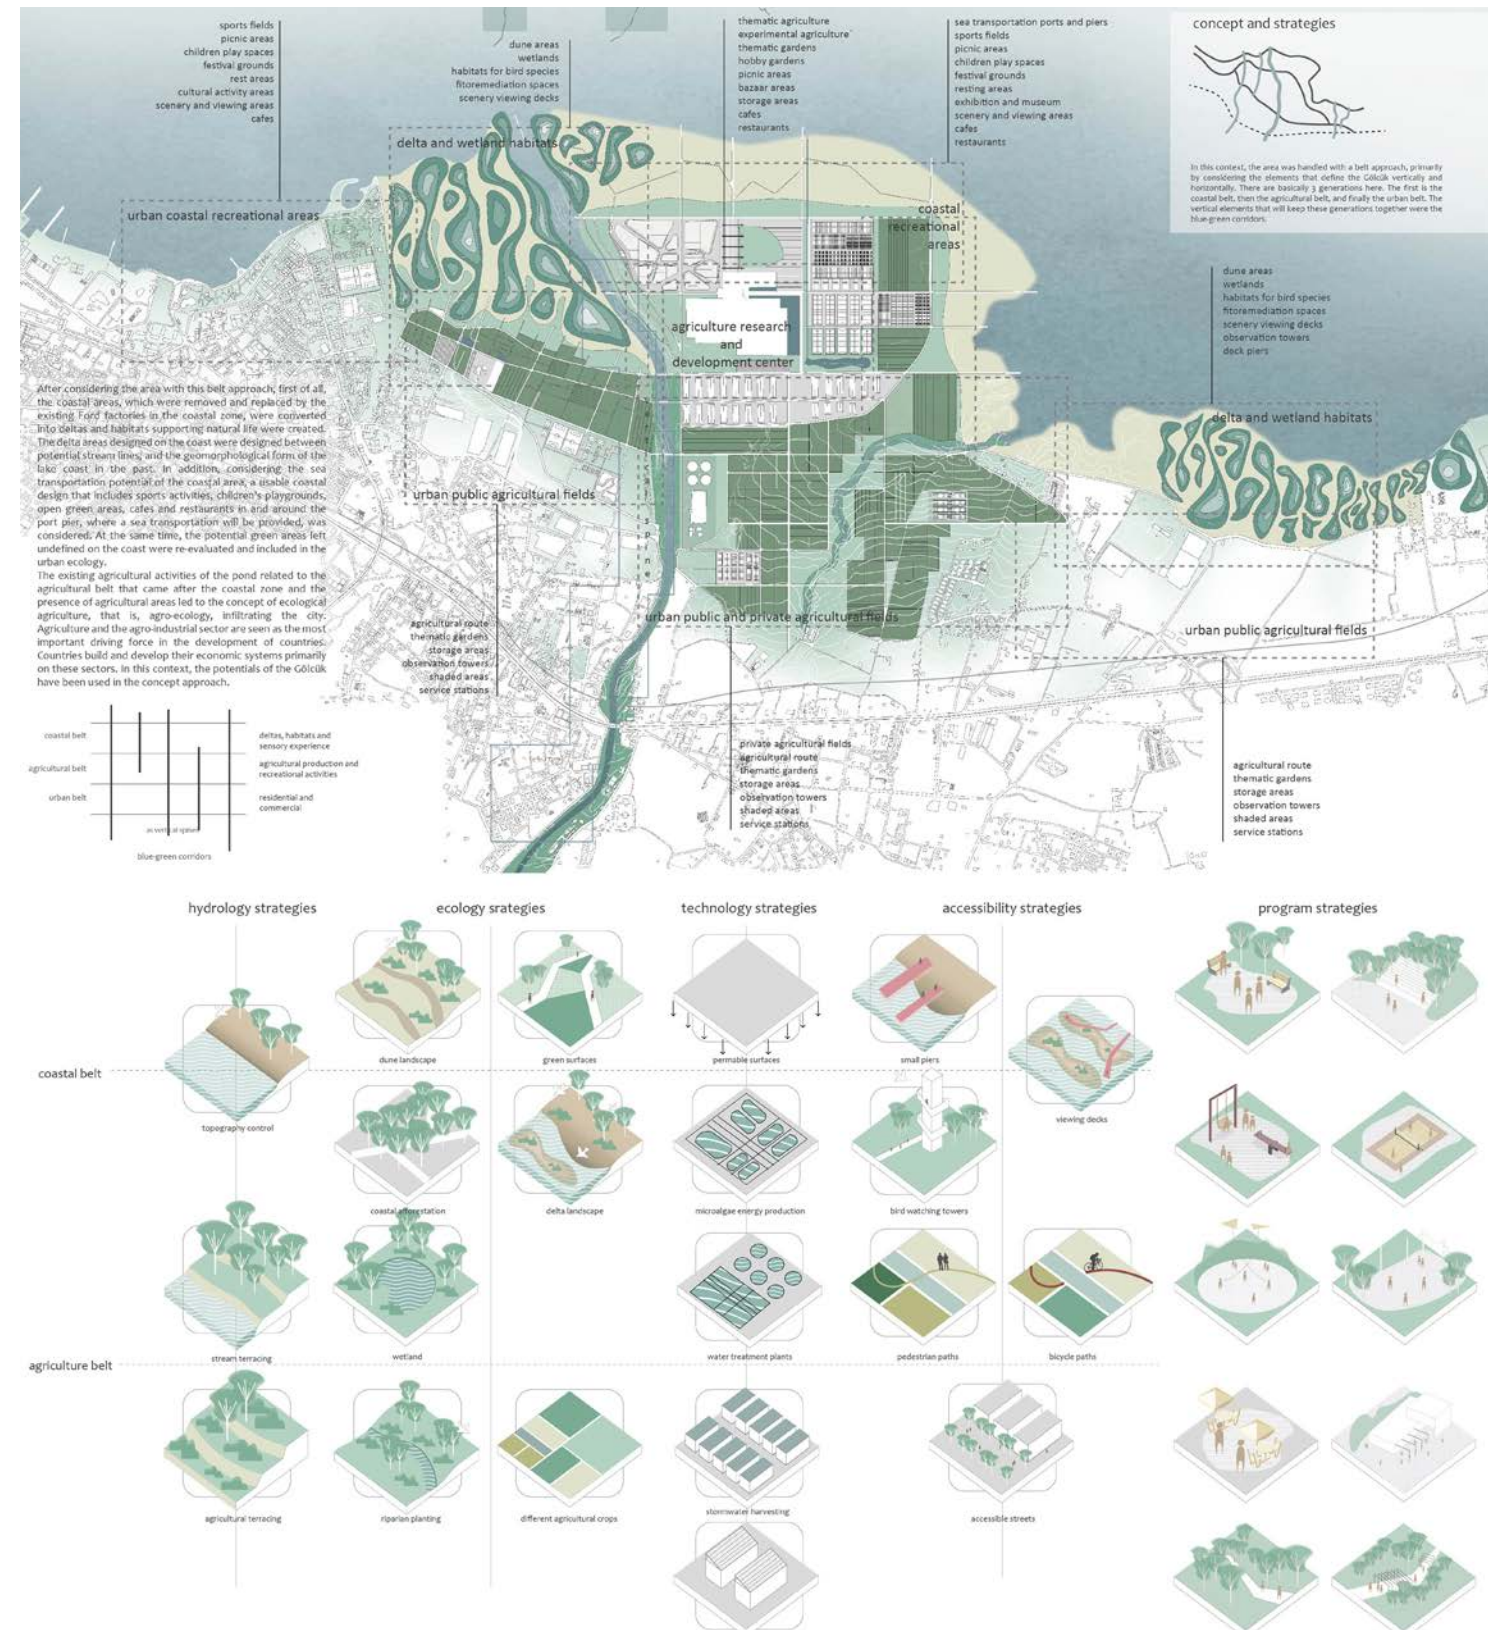

Upon reviewing the open green spaces around the pond, city parks along the beach are prominent, yet there are also undefined areas with potential for development. Behind the Ford factory lies a large expanse of farmland, showcasing two distinct modes of production: industrial and agricultural.

To address these issues, the proposal includes several key decisions: improving green spaces along the existing streamlines, uncovering the ecological value of the underutilized coastal areas, and transforming the existing industrial zones with a compromise strategy.

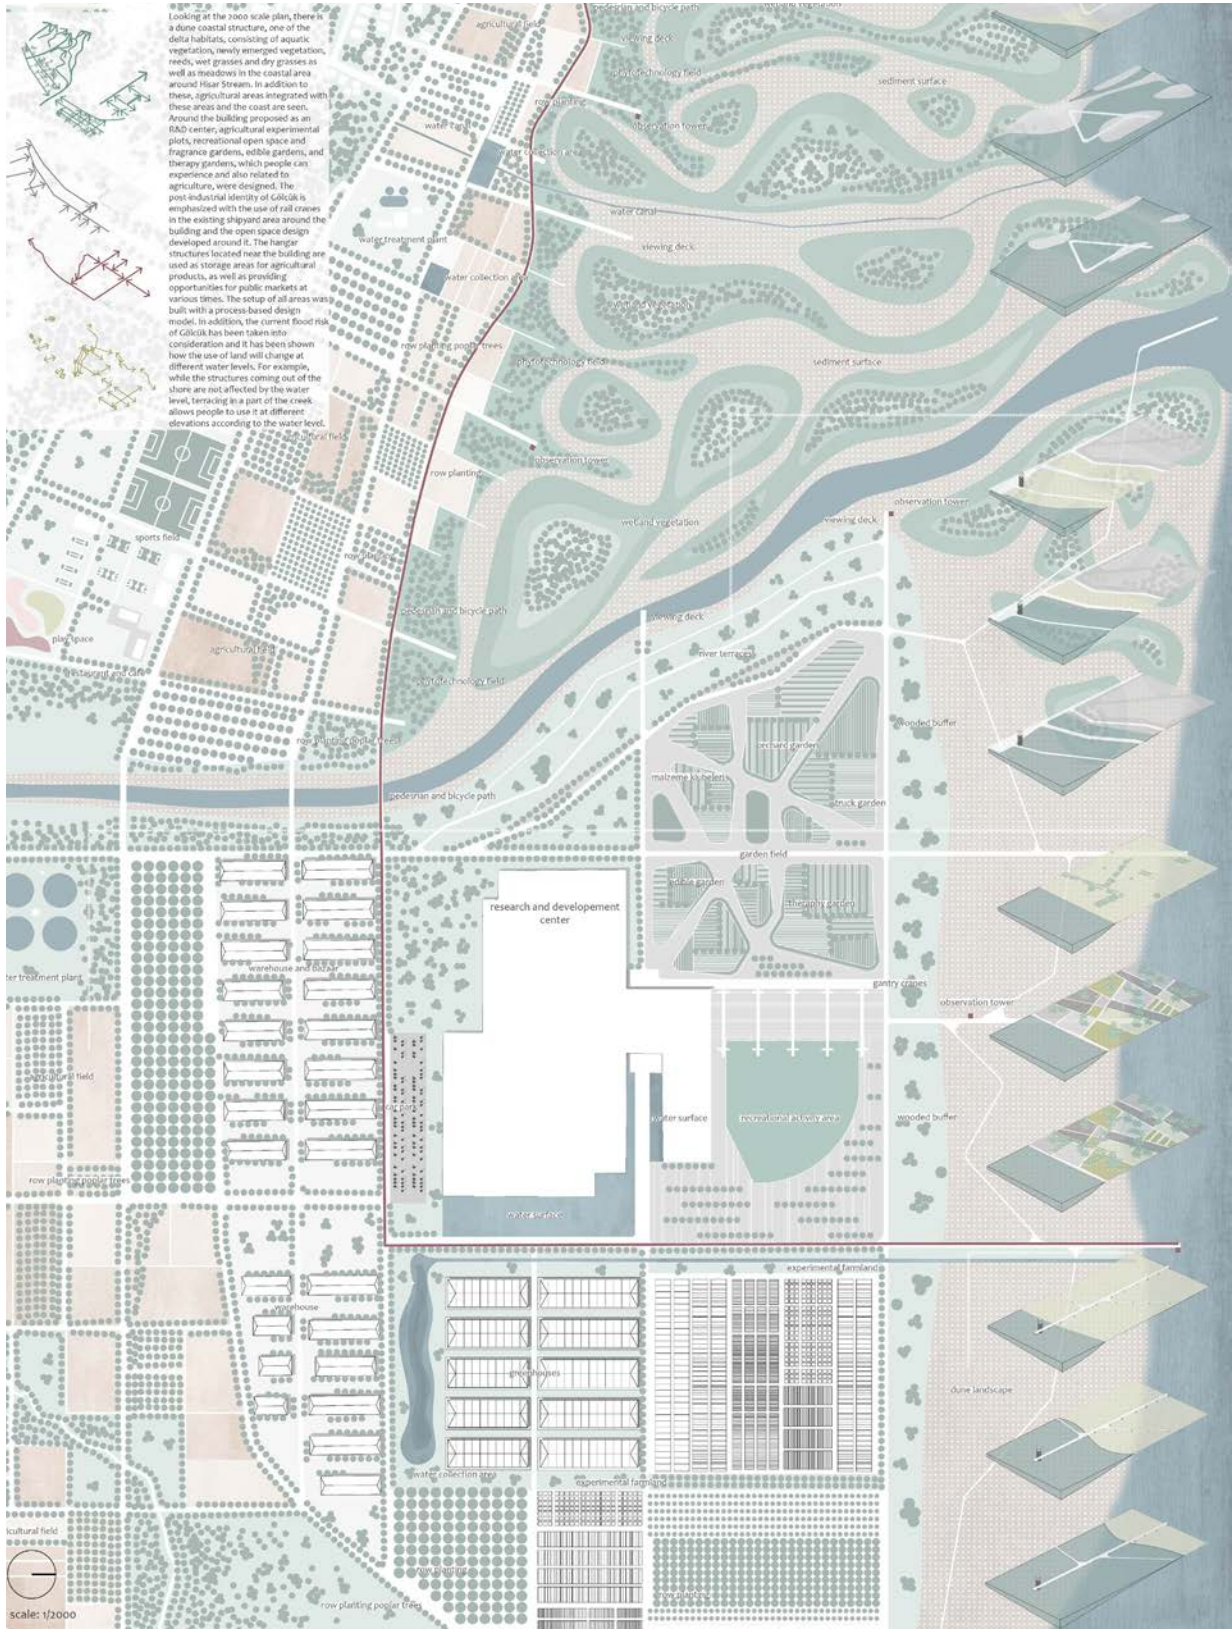

The design approach adopted is a “belt” strategy, which integrates both vertical and horizontal elements that define the Gölcük region. This strategy identifies three primary zones: the coastal belt, the agricultural belt, and the urban belt. The blue-green corridors serve as the unifying vertical elements that connect these zones. The first step in this approach is the transformation of the coastal areas, which were previously filled and occupied by Ford factories, into deltas and habitats that support local wildlife. The delta areas are designed along the lines of potential streams, mimicking the historical geomorphological form of the lake coast. Additionally, given the coastal area’s sea transportation potential, a design for a multifunctional coastal space has been proposed. This includes sports facilities, children’s playgrounds, open green spaces, cafes, and restaurants, as well as a port pier that will support sea transport activities.

Furthermore, the previously undefined green areas along the coast are being re-evaluated and integrated into the broader urban ecology plan, ensuring that they contribute to the environmental and social vitality of the region.

2021-2022 Fall

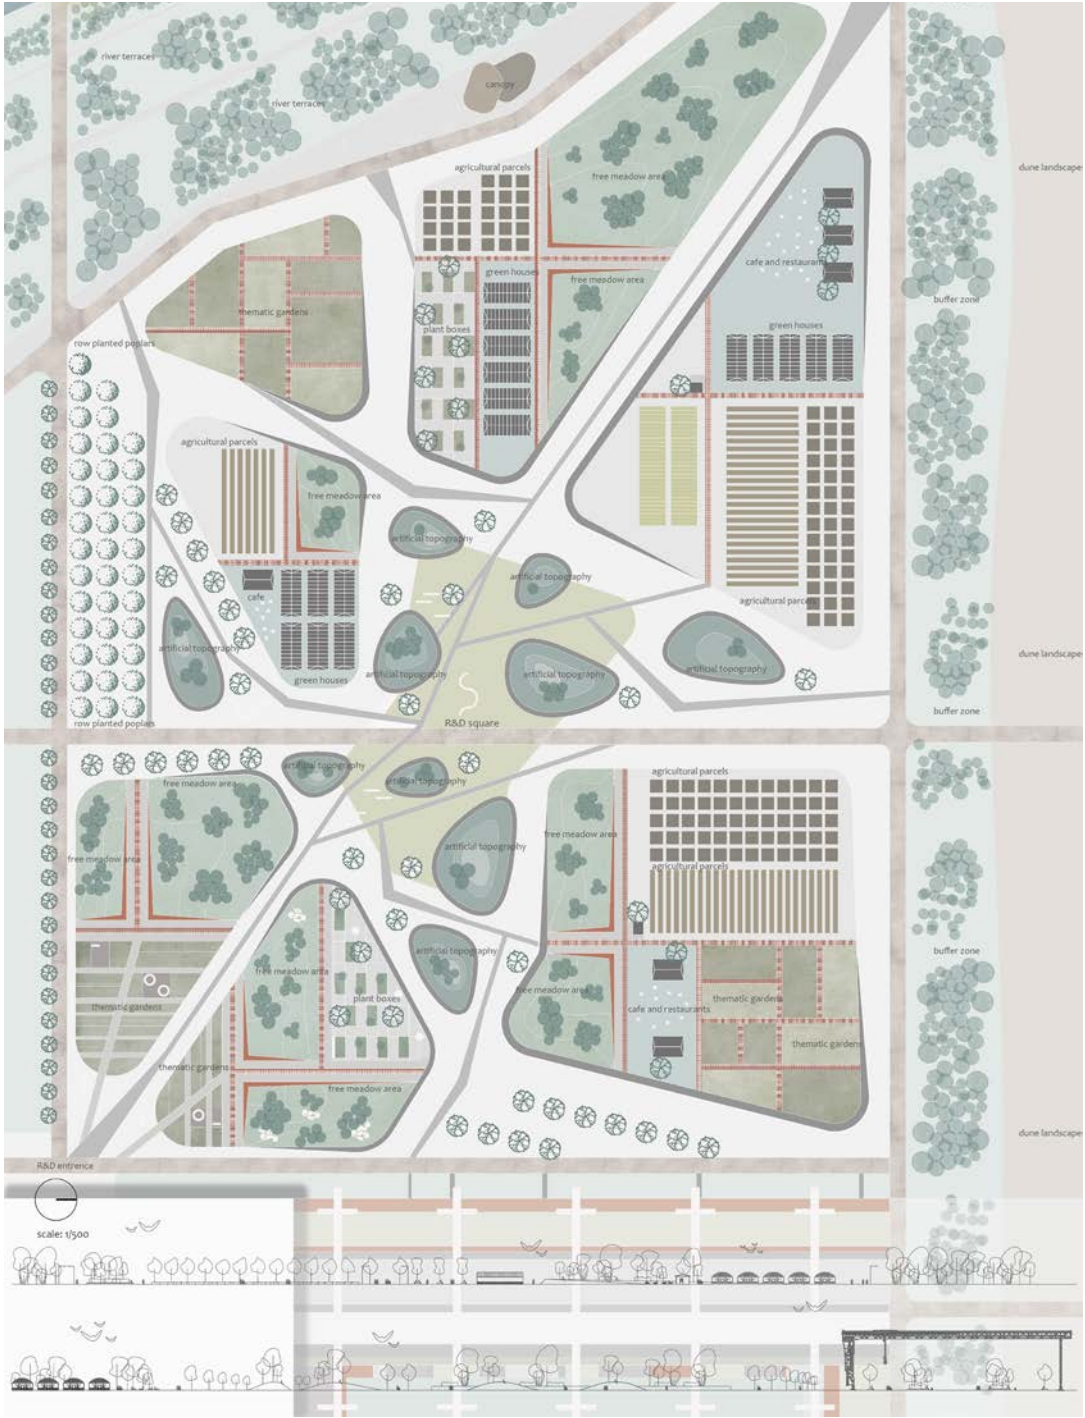

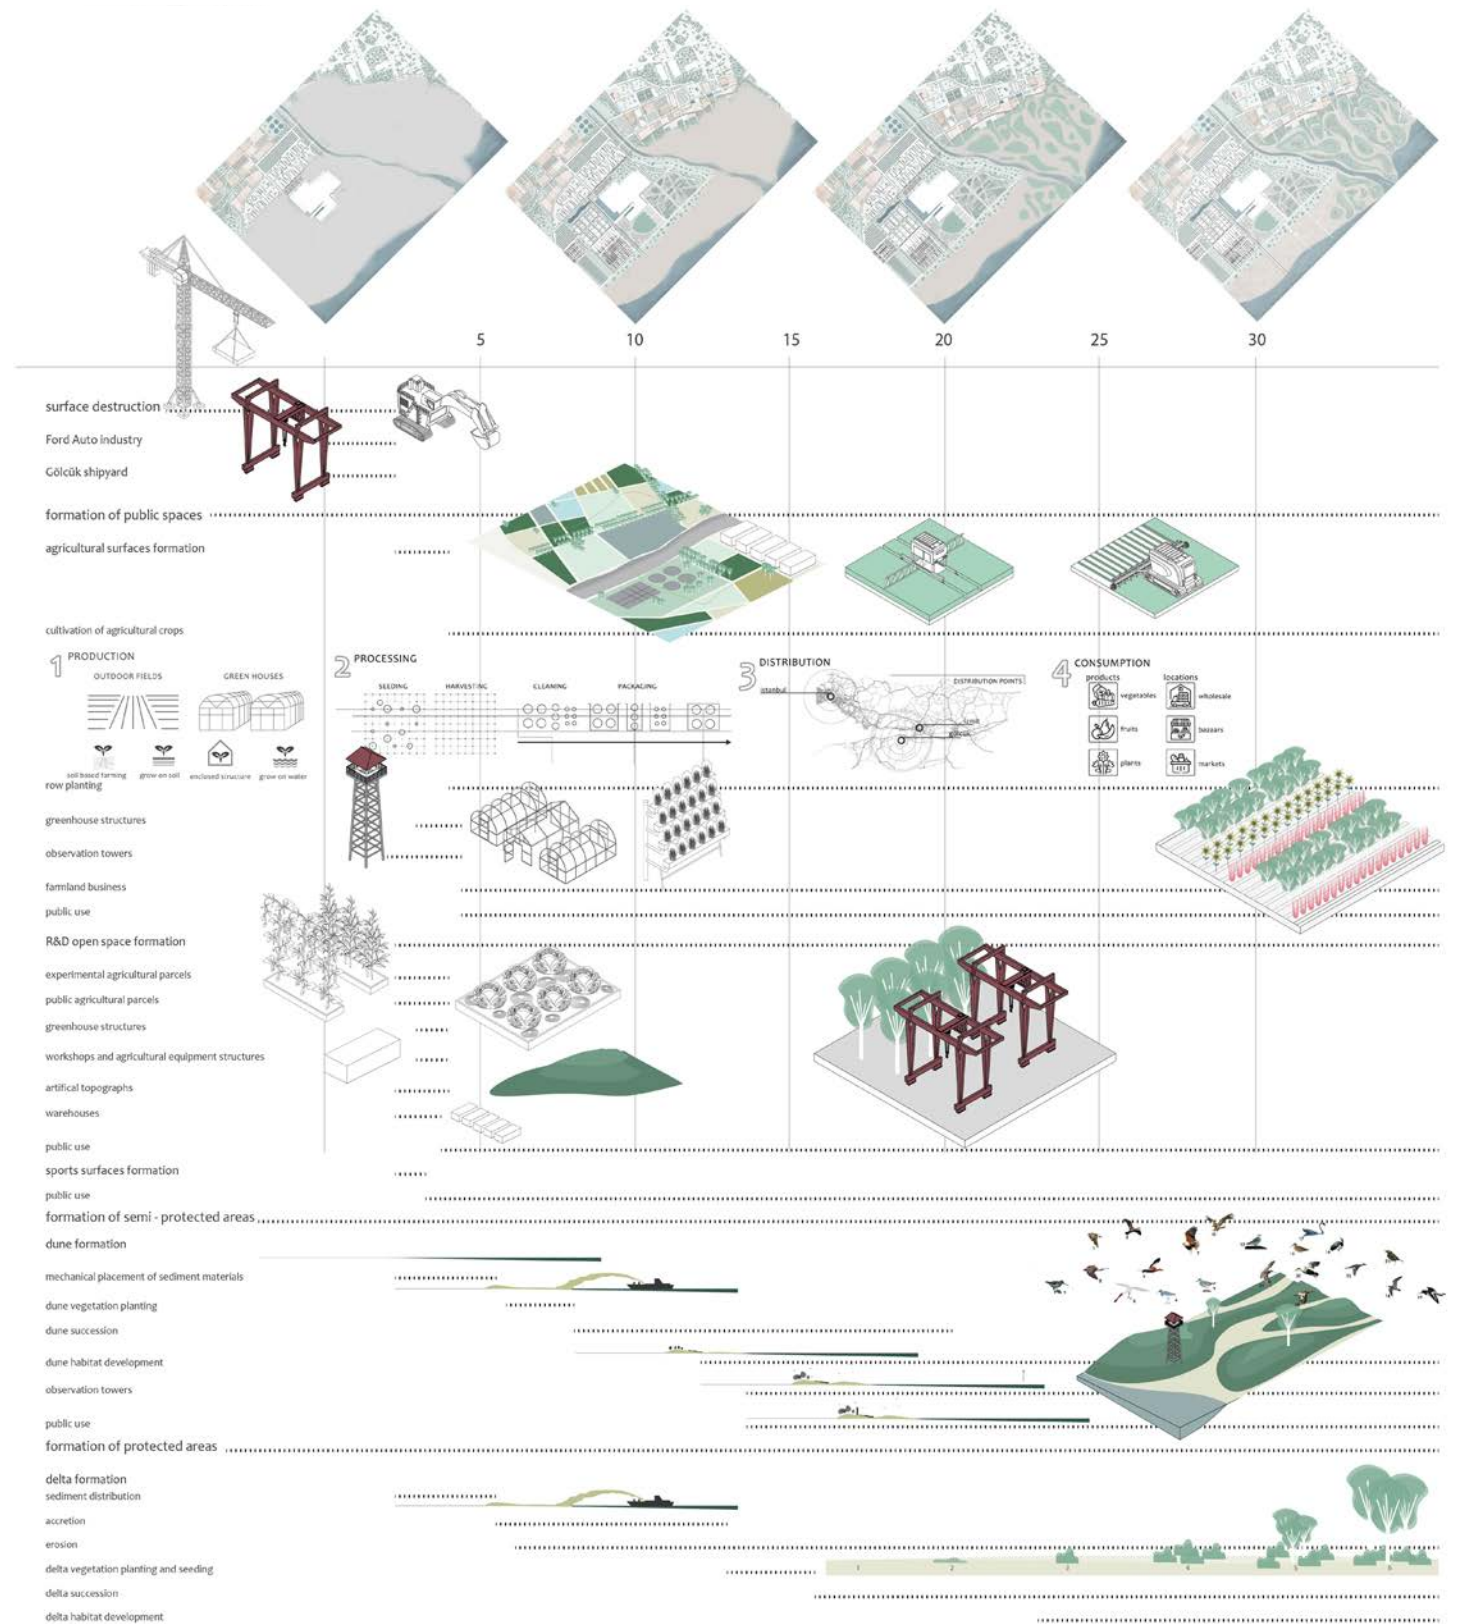

439

Three basic improvement strategies have been identified to improve, correct, and enhance the area, including upper-scale decisions. The first is phytoremediation, a type of phytotechnology under the remediation strategy, aimed at using plants and related soil microbes to reduce the toxic effects of pollutants and filter agricultural wastes from the water.

The second strategy is succession, part of the reconciliation strategy, which focuses on the change process in the species structure of the ecological community over time to reveal the region's ecological values. The final strategy is agricultural ecology, which aims to reconcile with the industrial identity of the region.

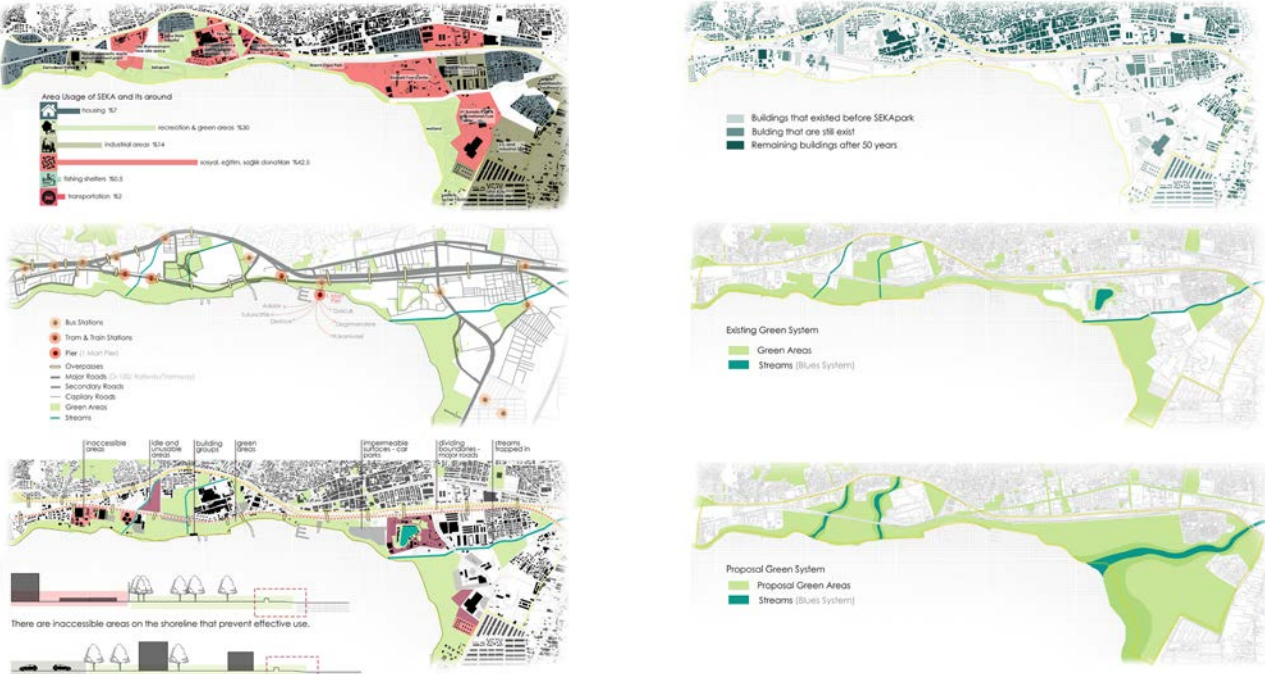

Cycle of Land

Merve Dilara Ezer

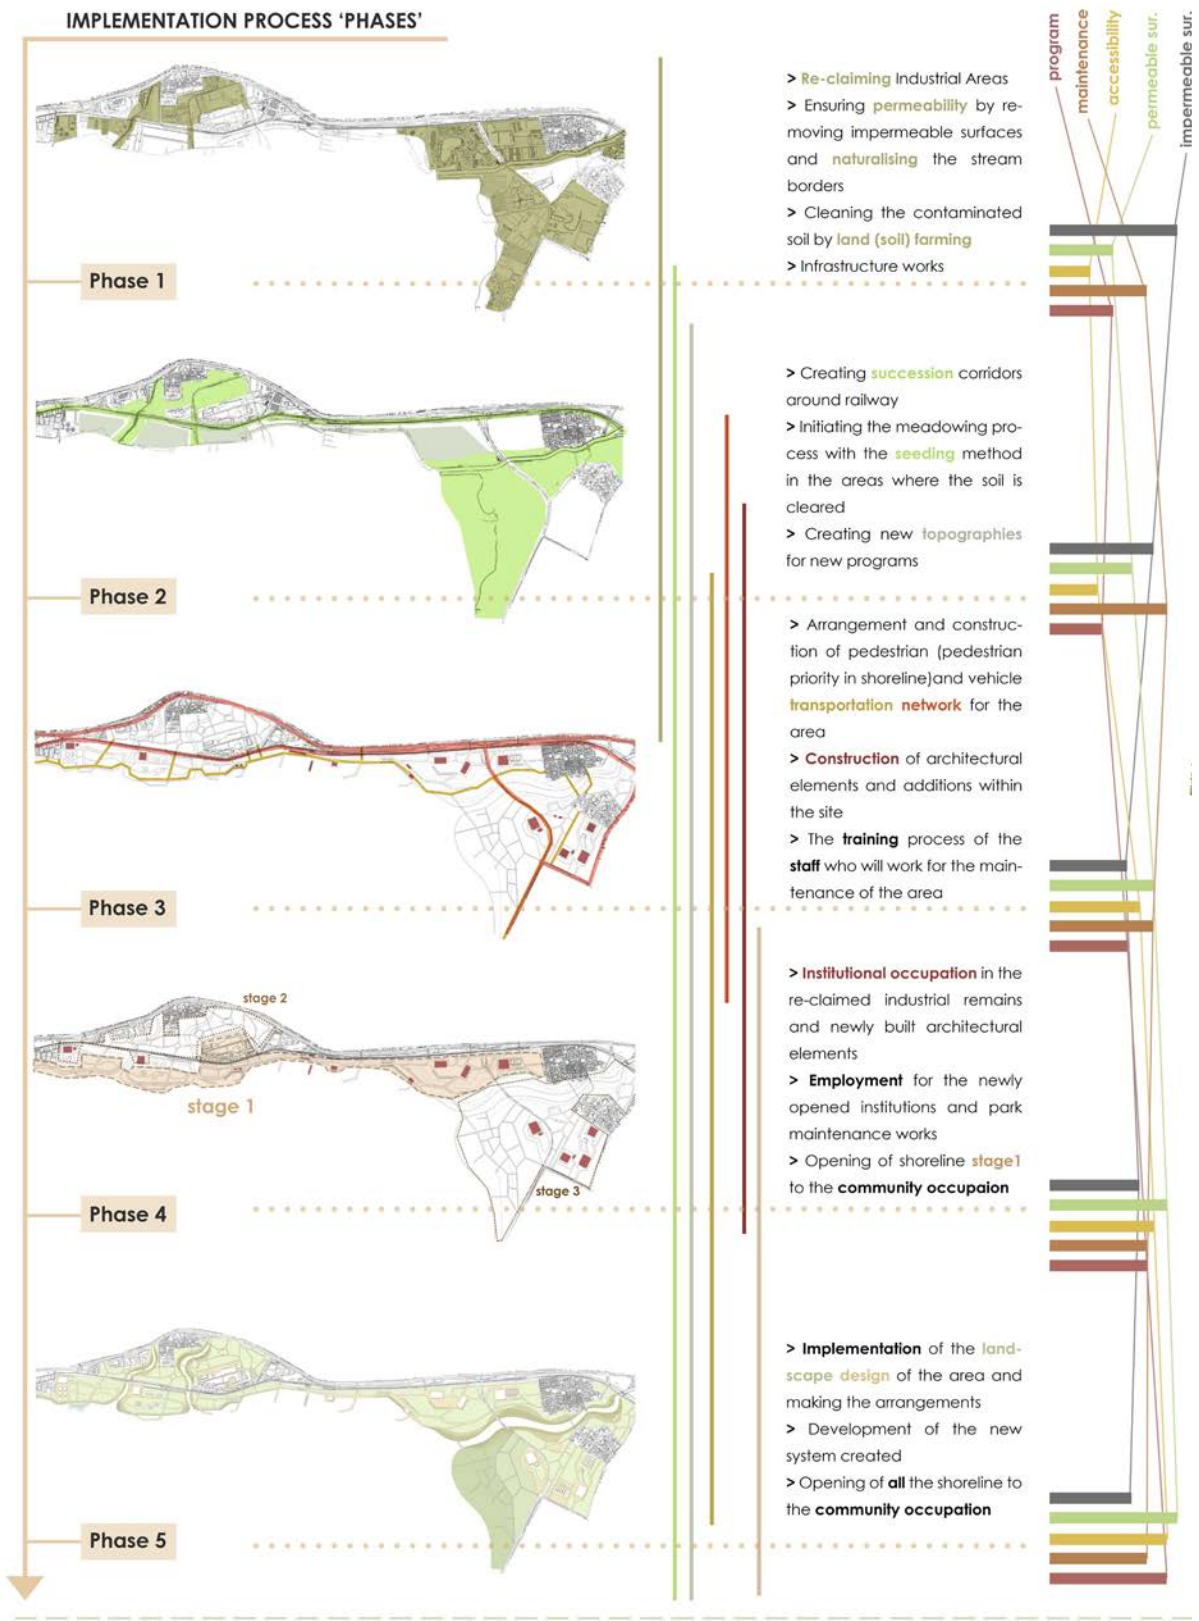

“Cycle of Land” was produced within the scope of Landscape Design IV carried out by Assoc. Prof. Meltem Erdem Kaya and Res. Assist. Nergis Aşar under the title “Reclaiming Landscape: Post-Industrial Scenarios for Gulf of Izmit” in the fall semester of 2021-2022.

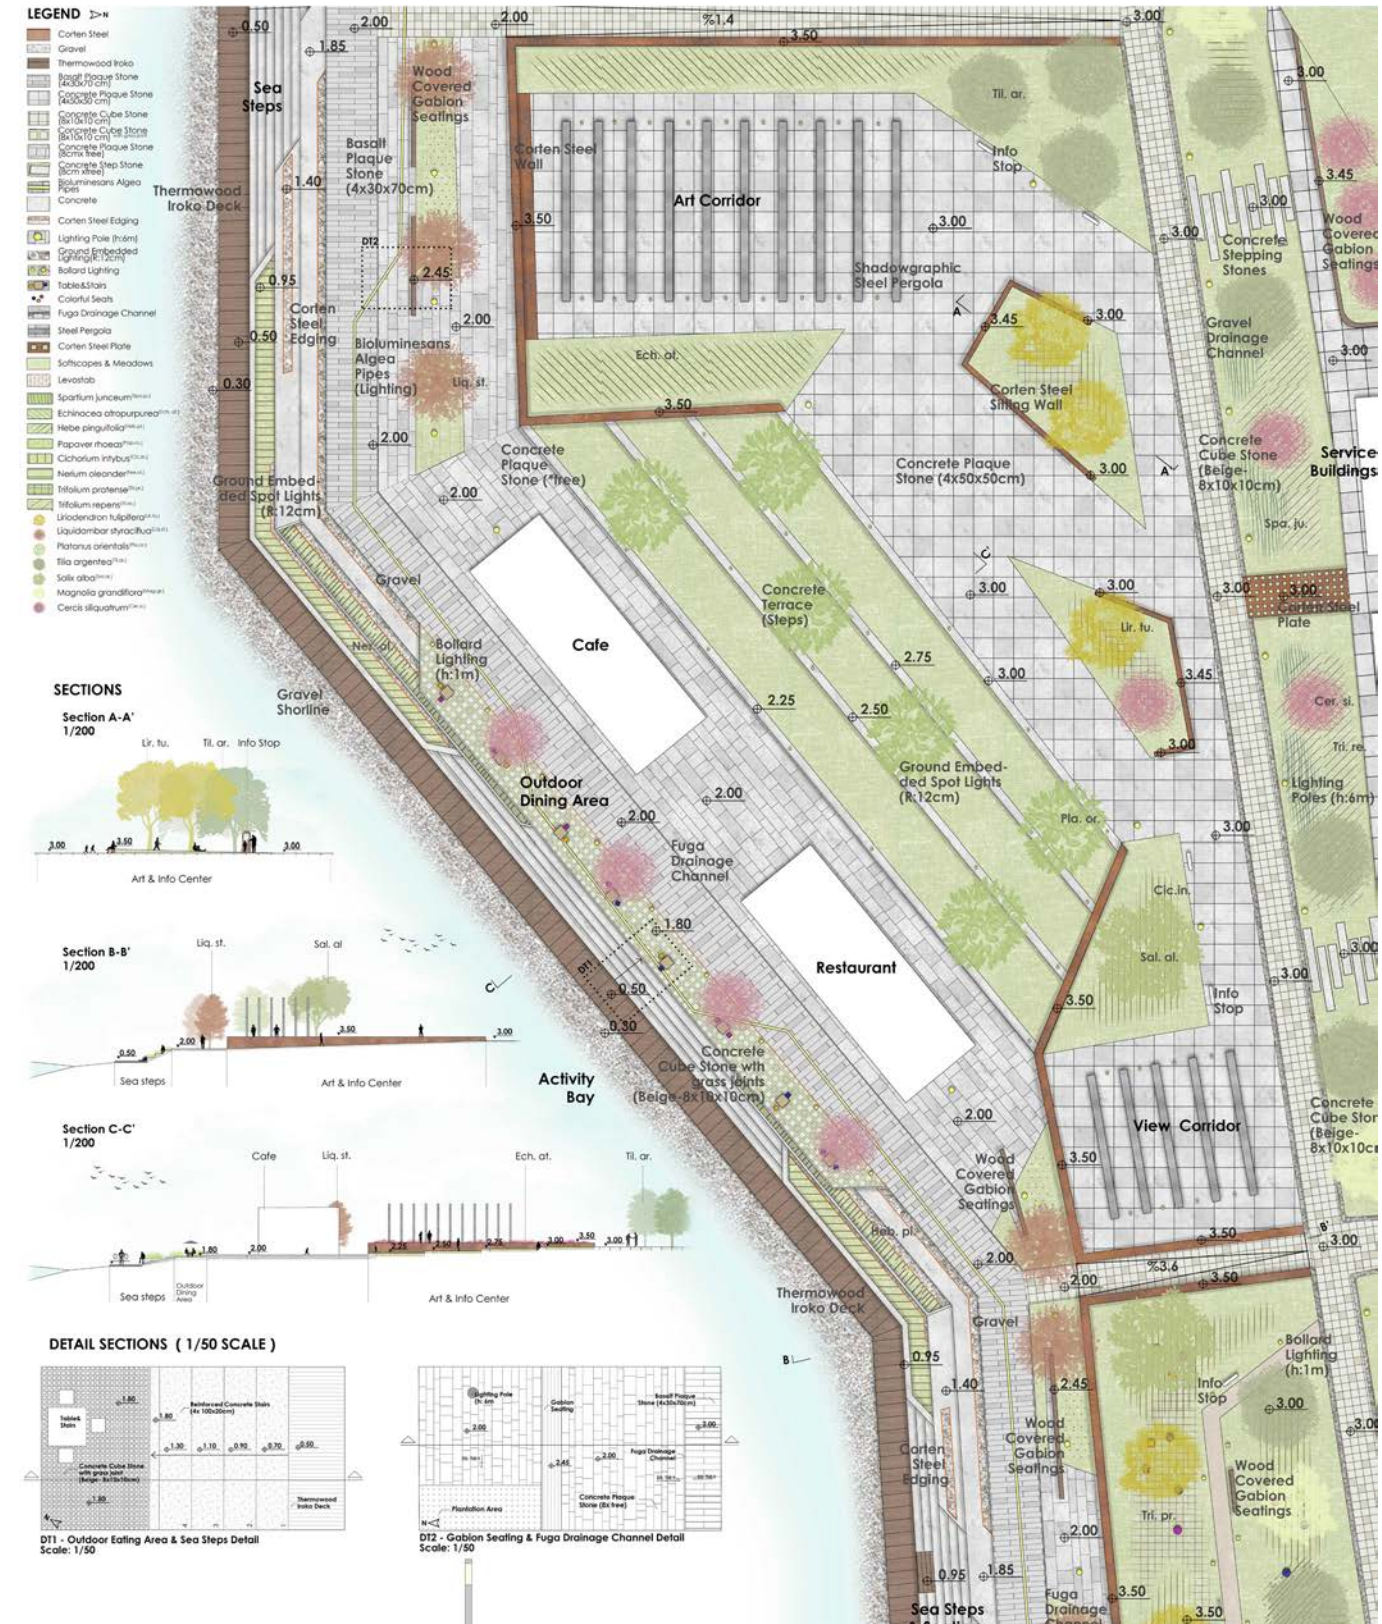

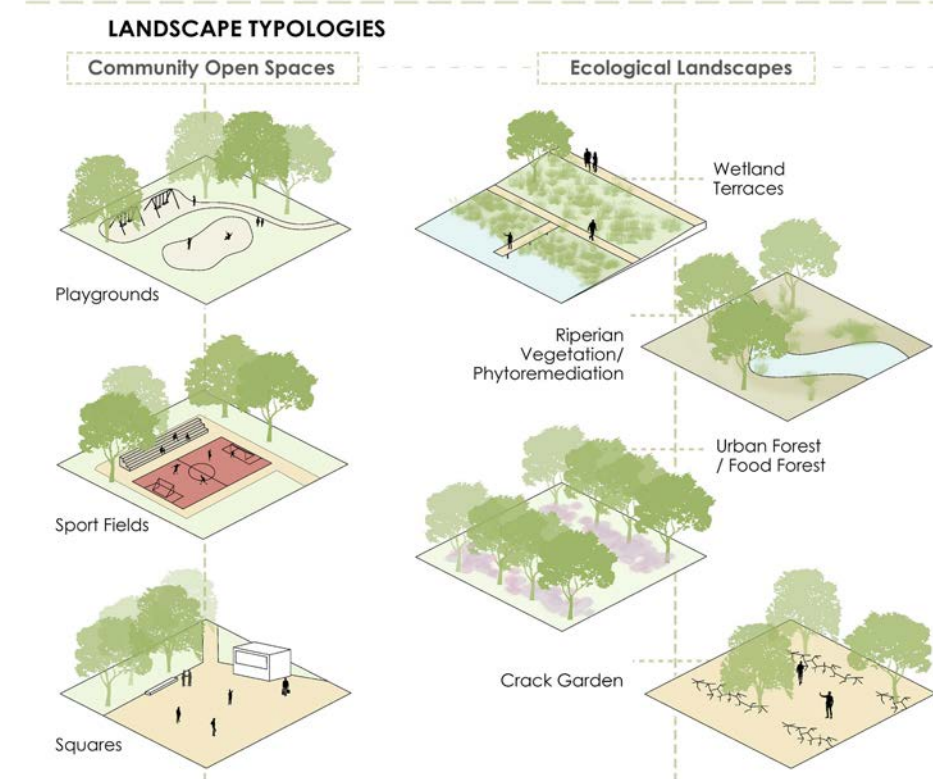

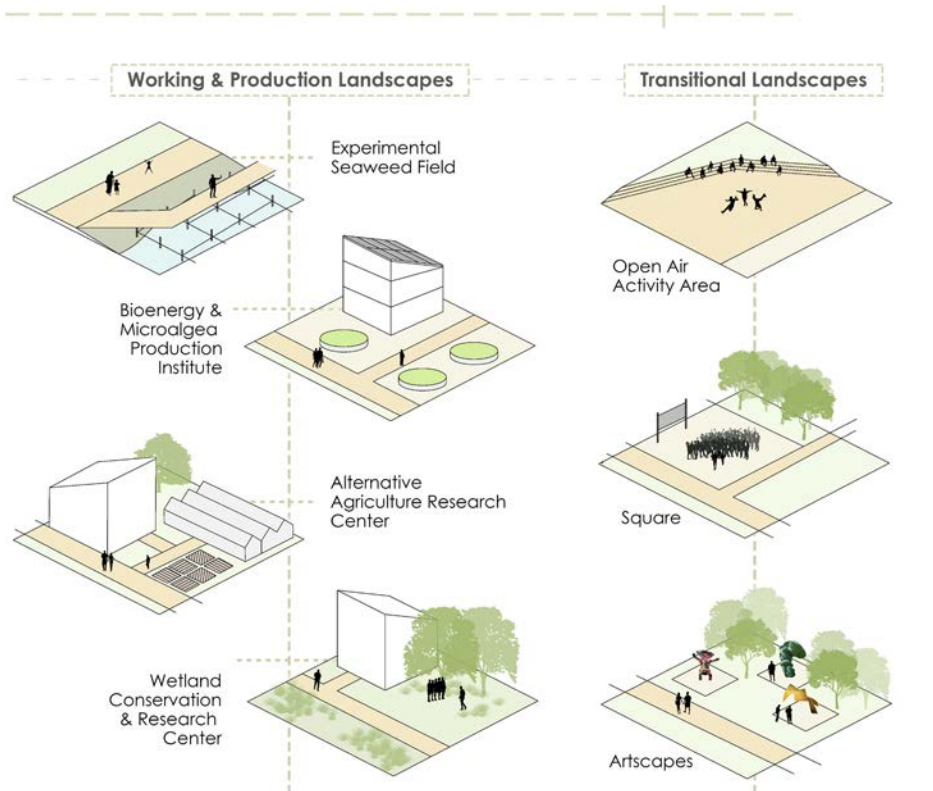

Drosscape areas, where industries and factories will be removed after 50 years, can be considered as “second chance areas,” where social and natural operations can be made visible as a collective effort. Building on these ideas, we coined the term “Reincarnation” and, using this concept, we analyzed the conditions of the area by asking how they were, how they are, and how they will be.

When I started working individually, I wanted to rethink the term “Reincarnation” while analyzing the Izmit SEKA region, which is my focus area. I found that reincarnation is typically defined as the life cycle of an essence. However, I wanted to address the essence as the land we live on—the ‘earth’—and view the cycle of life in reincarnation as the ‘Cycle of Land.’ I realized that a significant production factor (industry) had been eliminated from the area and thought that this production activity could be combined with the landscape. From this, I coined the term ‘Productive Landscapes’ and built my design around it. After conducting the analysis, as the concept plan was being developed, I aimed to create new functions in the area by considering the future of the site in 50 years, focusing on energy, science/culture, food, ecological values, and sociability. I emphasized what could be produced in the area in this new situation, starting from the idea of a productive landscape. The proposed functions include: bioenergy research centers, algae & seaweed production centers under the energy category; wetland

conservation and research centers, hydroponic and aeroponic alternative agriculture research centers, SEKA, science and archaeology museums, and treatment pool digital art areas under the science/culture heading, along with the functions that develop around them. Additionally, there are edible landscape areas, city and coastal squares, urban forests and woodlands, wetland terraces, and rehabilitated and naturalized streamlines under the headings of ecology, food, and sociality. A large-scale productive landscape matrix is created by interconnecting the proposed functions. In this matrix, alongside spaces for sports, games, gathering, conversation, and relaxation, research and production centers are integrated in line with a future scenario that anticipates the continuation and development of the information and technology age. Along the coastline, where the rigid urban texture meets the dynamism of the sea, the design was shaped based on the form I termed “dynamic rigidity,” which combines both textures.

BİTİRME PROJESİ GRADUATION PROJECT

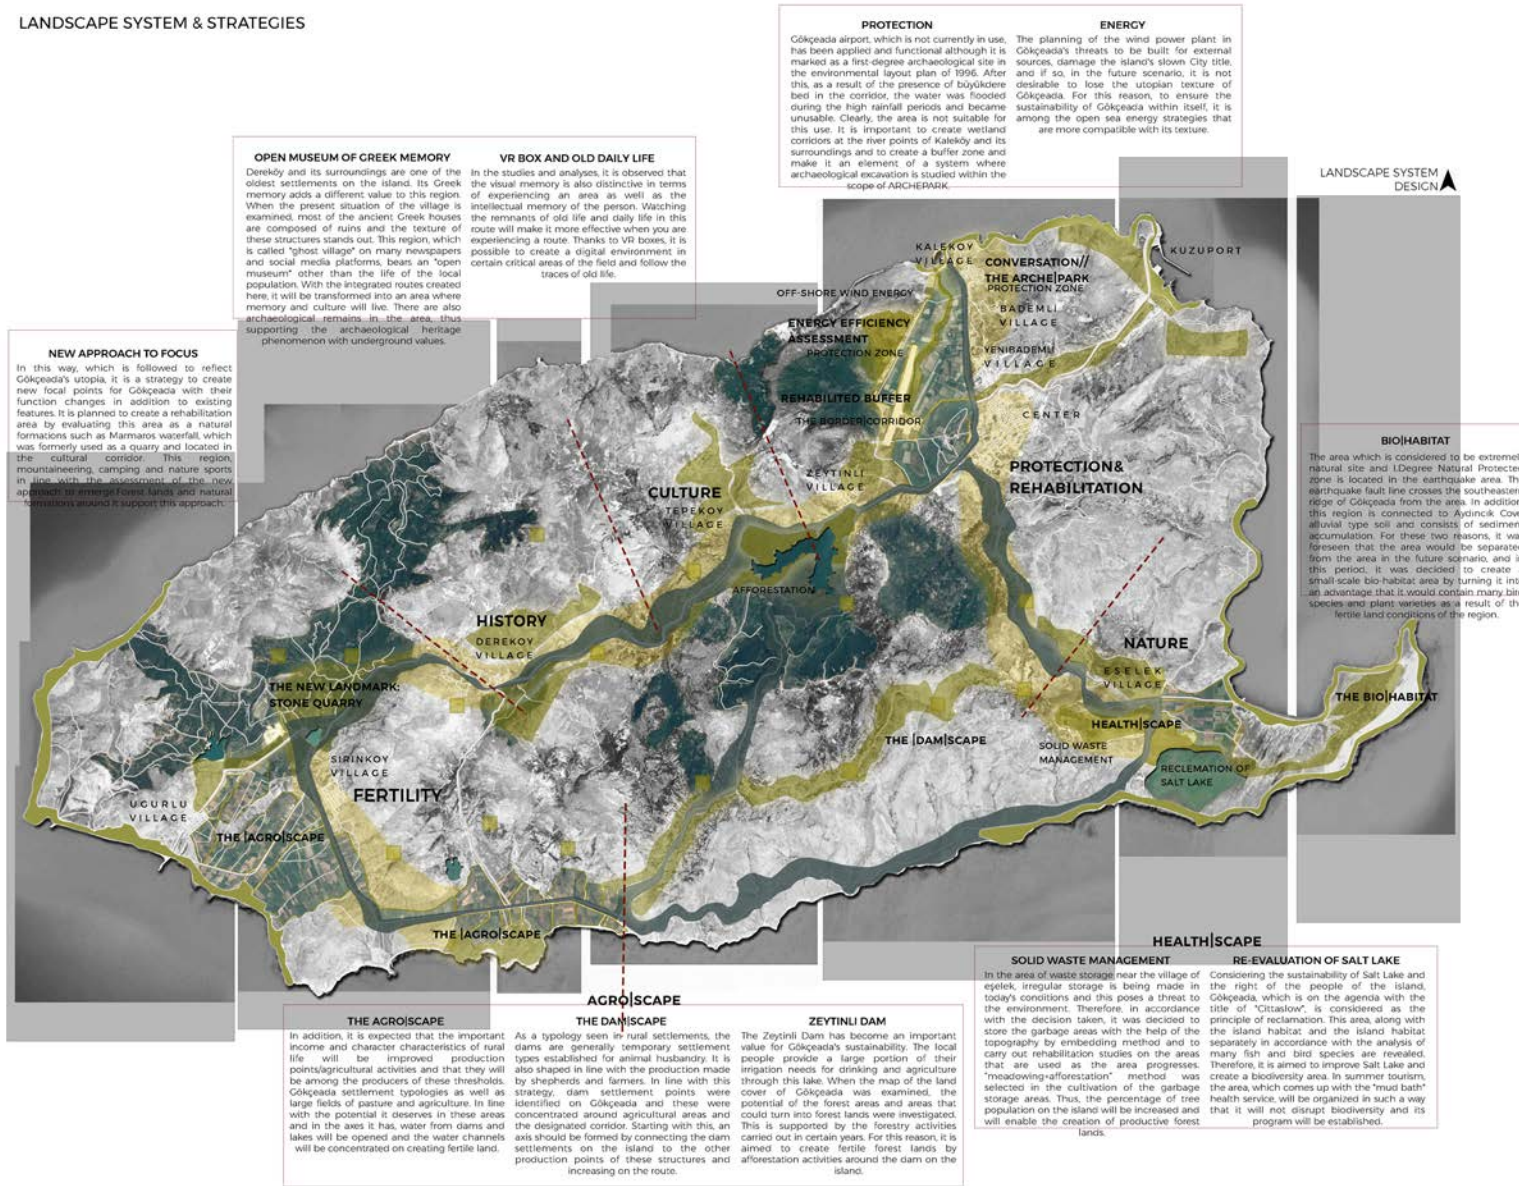

Diasporal Arcadia

Melisa Aksun

“Diasporal Arcadia” was produced within the scope of Graduation Project carried out by Prof. Dr. Meltem Erdem Kaya, Prof. Dr. F. Ayçim Türer Başkaya, Assist.Prof. Dr. Muhammed Ali Örnek, Assoc. Prof. Dr. Melih Bozkurt, M.Sc. Land Arch. Arzu Nuhoğlu, and Lecturer. Dr. Gökçer Okumuş and assisted by Res. Assist. Elif Serdar Yakut and Res. Assist. Merve Aydınli under the title “Gökçeada - On the Track of Cultural Contunuity Greek Villages” in the spring semester of 2018-2019.

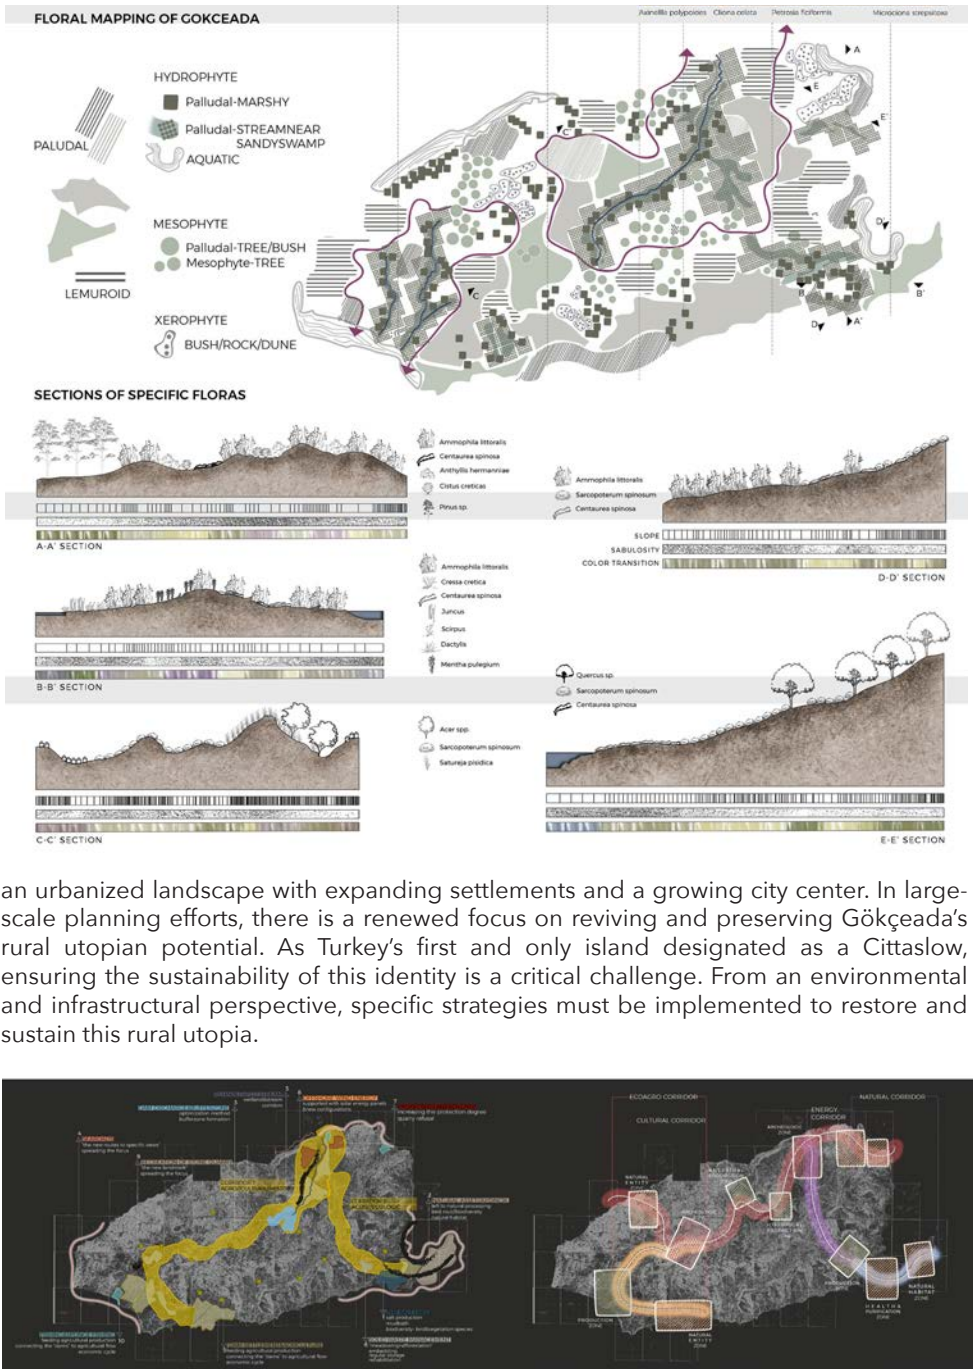

* TMMOB Chamber of Landscape Architects • 8th Landscape Architecture Students Graduation Project Awards Equivalent Award, Selection Committee Special Award

LANDSCAPE SYSTEM & STRATEGIES

Diasporal Arcadia Takes Over Gökçeada, a Forgotten Utopia

Gökçeada was once a self-sufficient utopia, as its history reveals. However, today, it evokes a sense of abandonment, as it struggles with the loss of its identity due to the erosion of its cultural values. The island has undergone significant demographic changes, particularly since the 1960s, driven by forced migration, the establishment of new Turkish villages, the presence of a semi-open prison, and the closure of Greek religious structures. Additionally, Gökçeada—historically known for its village-based character—is steadily transforming into

an urbanized landscape with expanding settlements and a growing city center. In large-scale planning efforts, there is a renewed focus on reviving and preserving Gökçeada's rural utopian potential. As Turkey's first and only island designated as a Cittaslow, ensuring the sustainability of this identity is a critical challenge. From an environmental and infrastructural perspective, specific strategies must be implemented to restore and sustain this rural utopia.

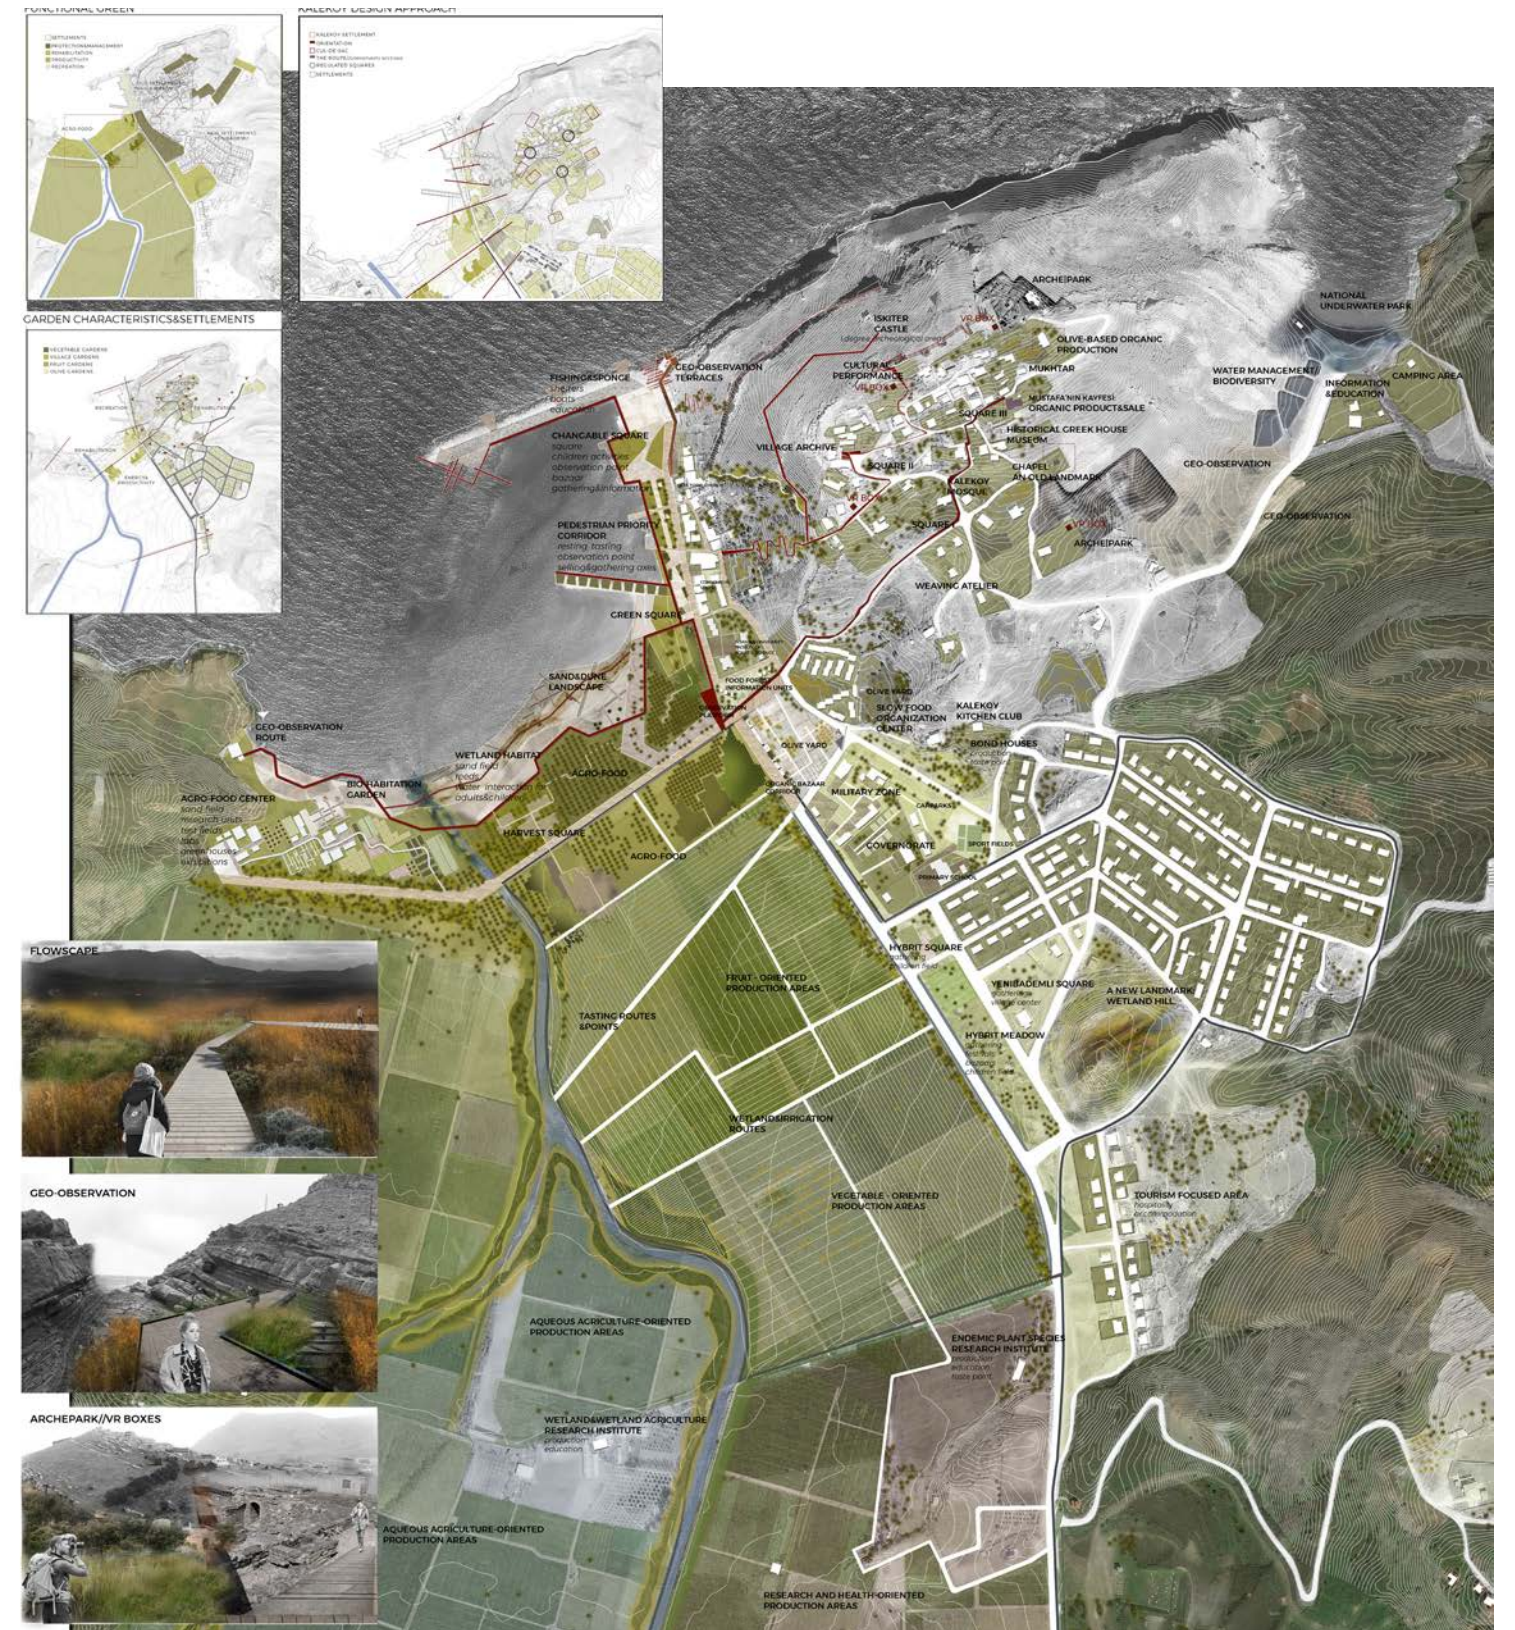

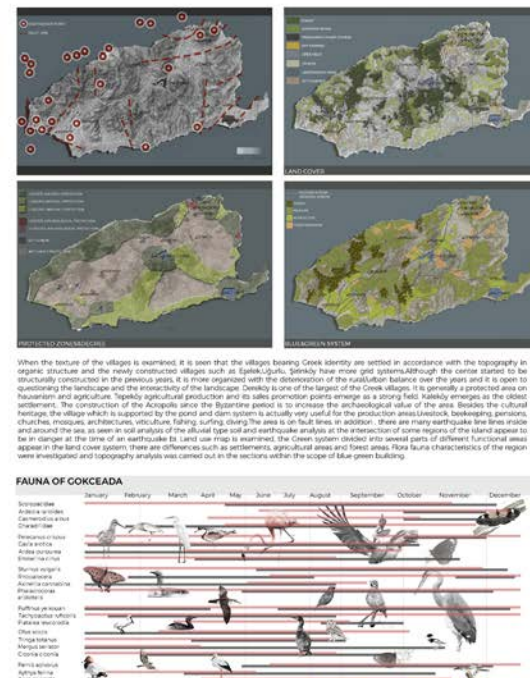

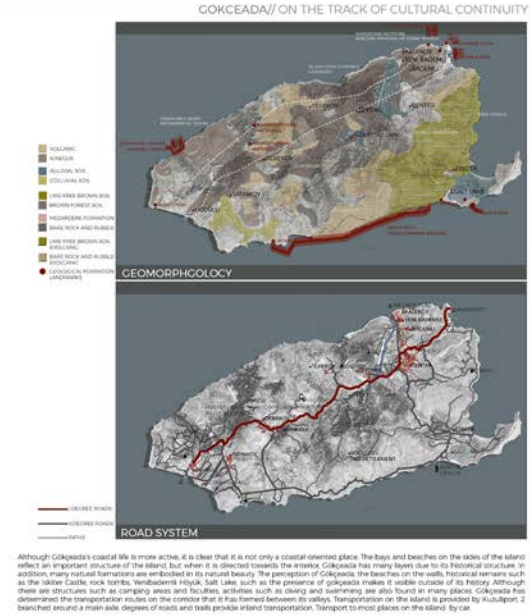

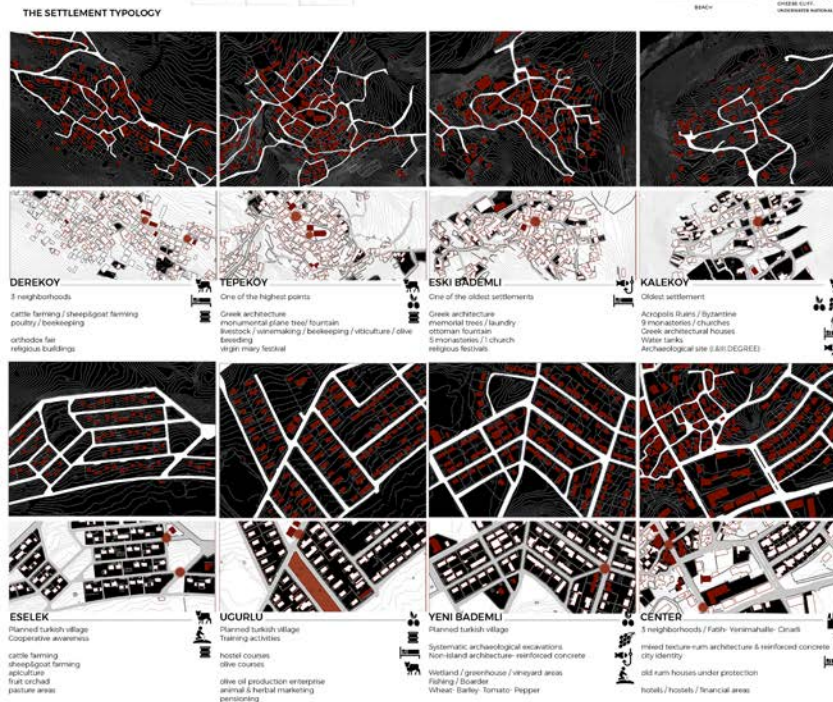

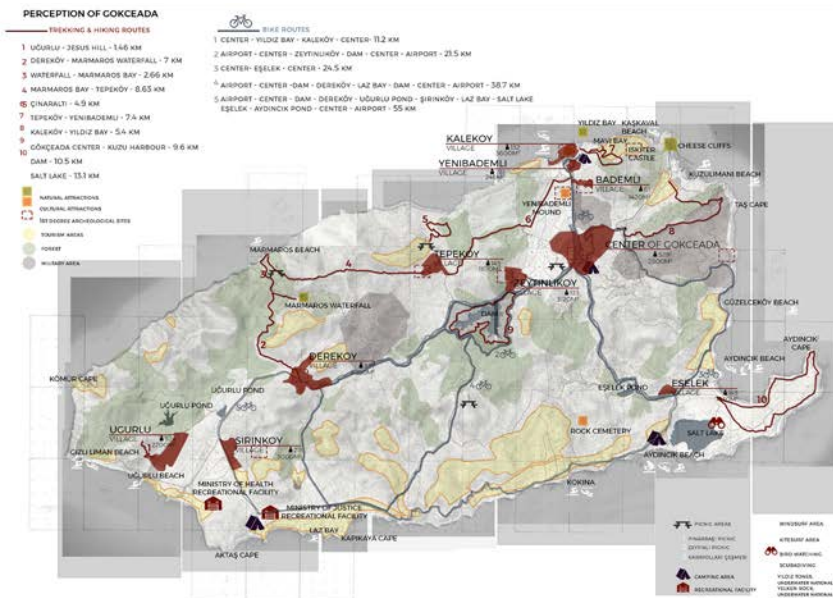

POPULATION STRUCTURE CHANGE IMPORTANT CASES

Gökçeada can be understood through two primary corridors: memory and nature. This framework brings together the interwoven concepts of agroecology and culture. Kaleköy, a coastal village, plays a vital role in both tourism and local life, especially during the summer months when the island is most active. Although Gökçeada's coastal areas hold significant design potential,

fostering a balance between the coast and the island's interior is equally crucial. This has led to a design approach centered on the concept of "agro-food-forest," which aims to extend the tourism economy inland while maintaining local agency in shaping tourism development. The Agro-Food strategy emphasizes ecological sustainability, active local

participation, and a balanced relationship between residents and tourists throughout the year. Kaleköy emerges as a focal point of both production and ecological sustainability, where local communities contribute to agricultural production in all seasons, and tourists engage in immersive experiences that help revive Gökçeada's utopian vision.

The strategy includes revitalizing existing landscapes, integrating agro-food principles, improving meadow areas, enhancing beach landscapes, and developing multifunctional agricultural zones. These may include poplar groves, fruit orchards, experimental fields, research units, laboratories, and olive groves—creating a space where both producers and the public can actively participate.

Furthermore, rehabilitating the island's dune landscapes and incorporating reed ecosystems into the design will enhance ecological resilience. Kaleköy, with its adaptable spaces supported by poplar woodlands, agro-food initiatives, and commercial hubs, is positioned to become an essential component of Gökçeada's reimagined utopia.

Roll-ing

Melike Tuğçe Çelik

"Roll-ing" was produced within the scope of Graduation Project carried out by Prof. Dr. Meltem Erdem Kaya, Prof. Dr. F. Aygün Türer Başkaya, Assist.Prof. Dr. Muhammed Ali Örnek, Assoc. Prof. Dr. Melih Bozkurt, M.Sc. Land Arch. Arzu Nuhoglu, and Lecturer. Dr. Gökçer Okumuş and assisted by Res. Assist. Elif Serdar Yakut and Res. Assist. Merve Aydınli under the title "Gökçeada - On the Track of Cultural Continuity Greek Villages" in the spring semester of 2018-2019.

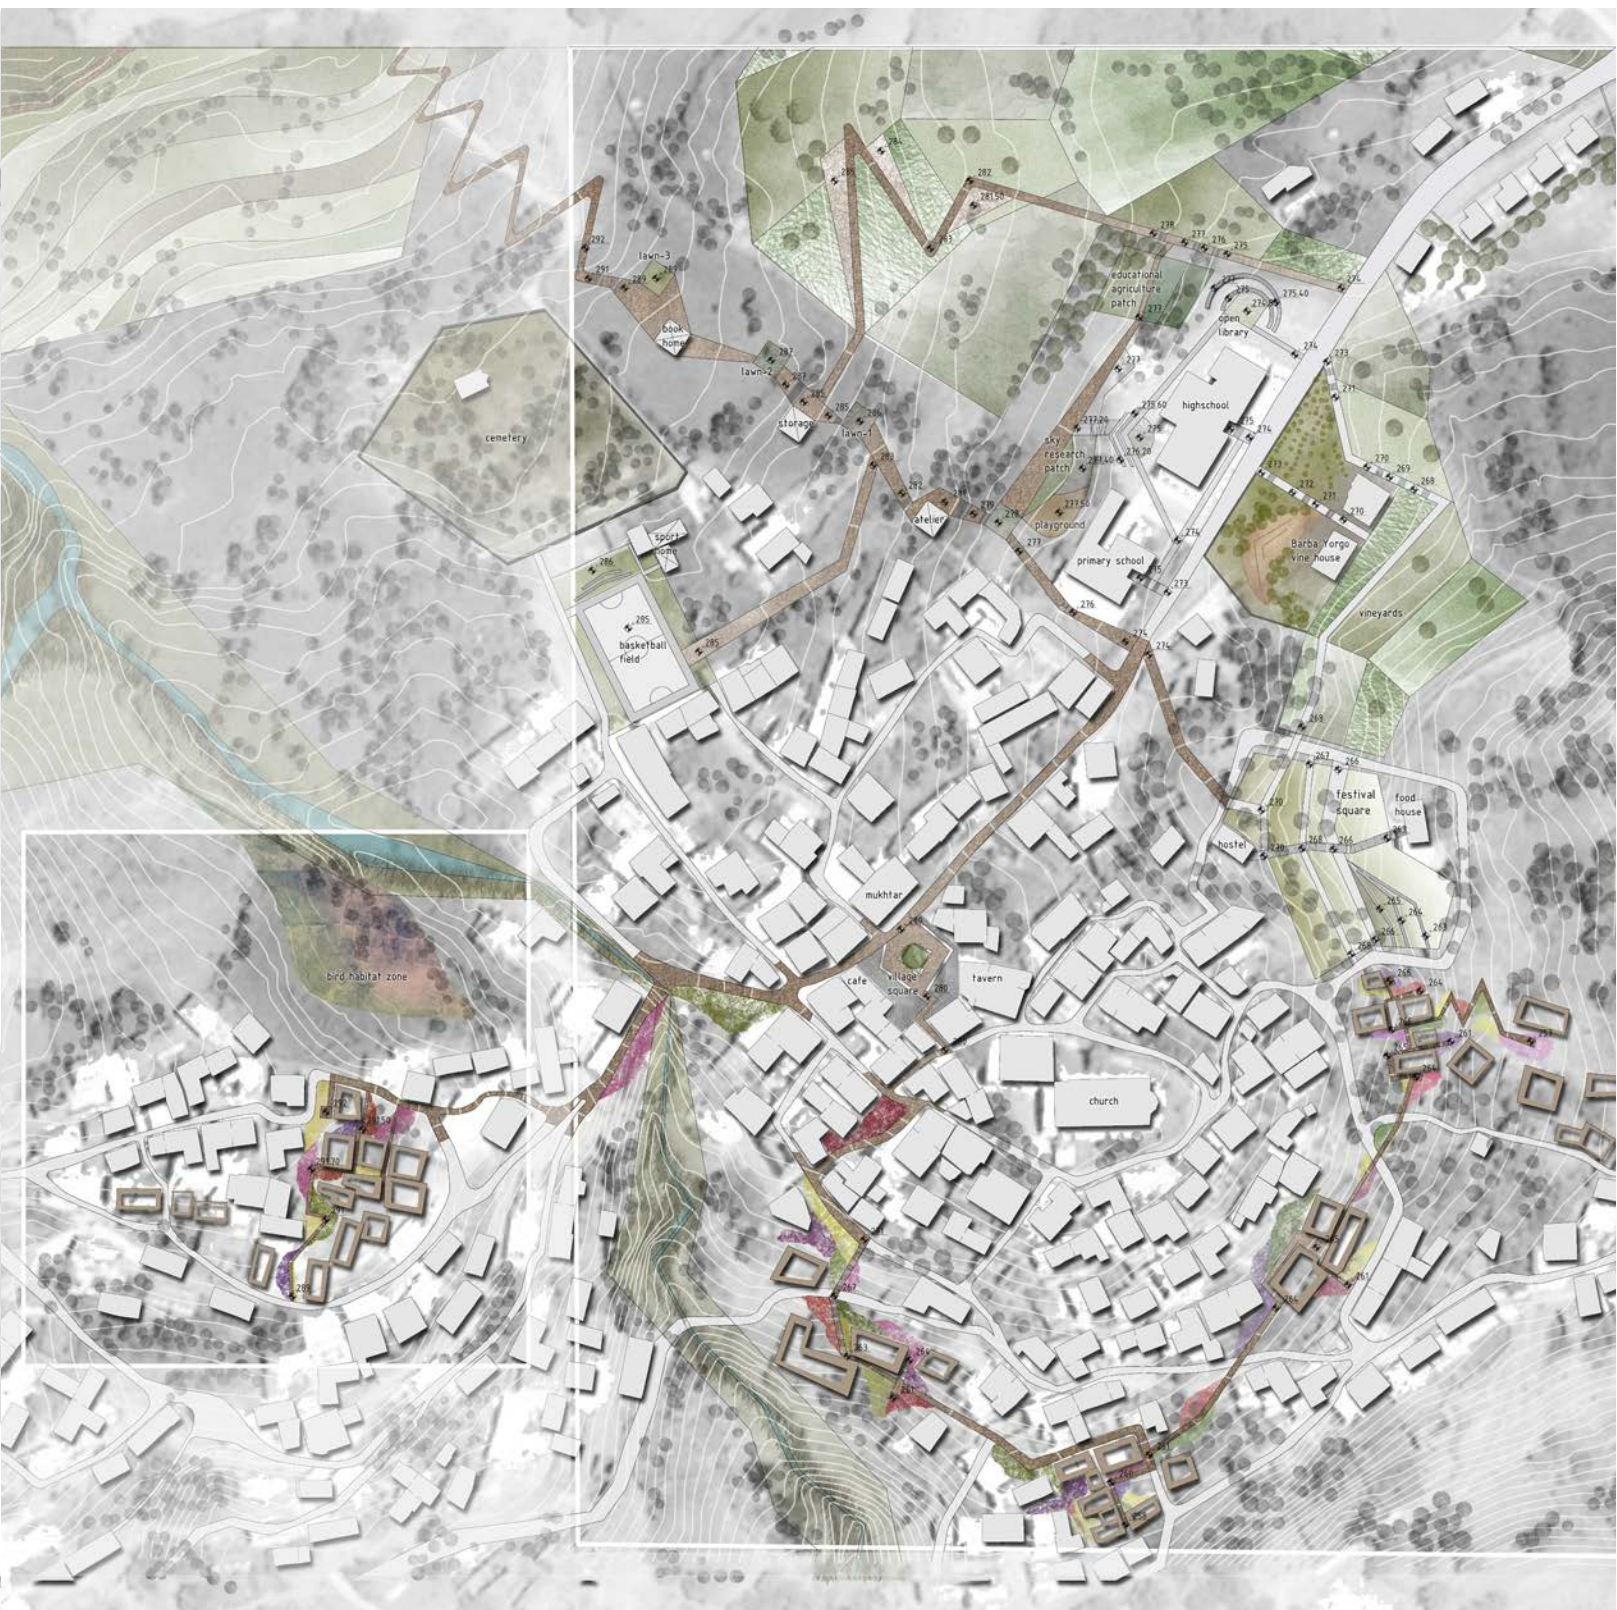

* TMMOB Chamber of Landscape Architects • 8th Landscape Architecture Students Graduation Project Awards Equivalent Award

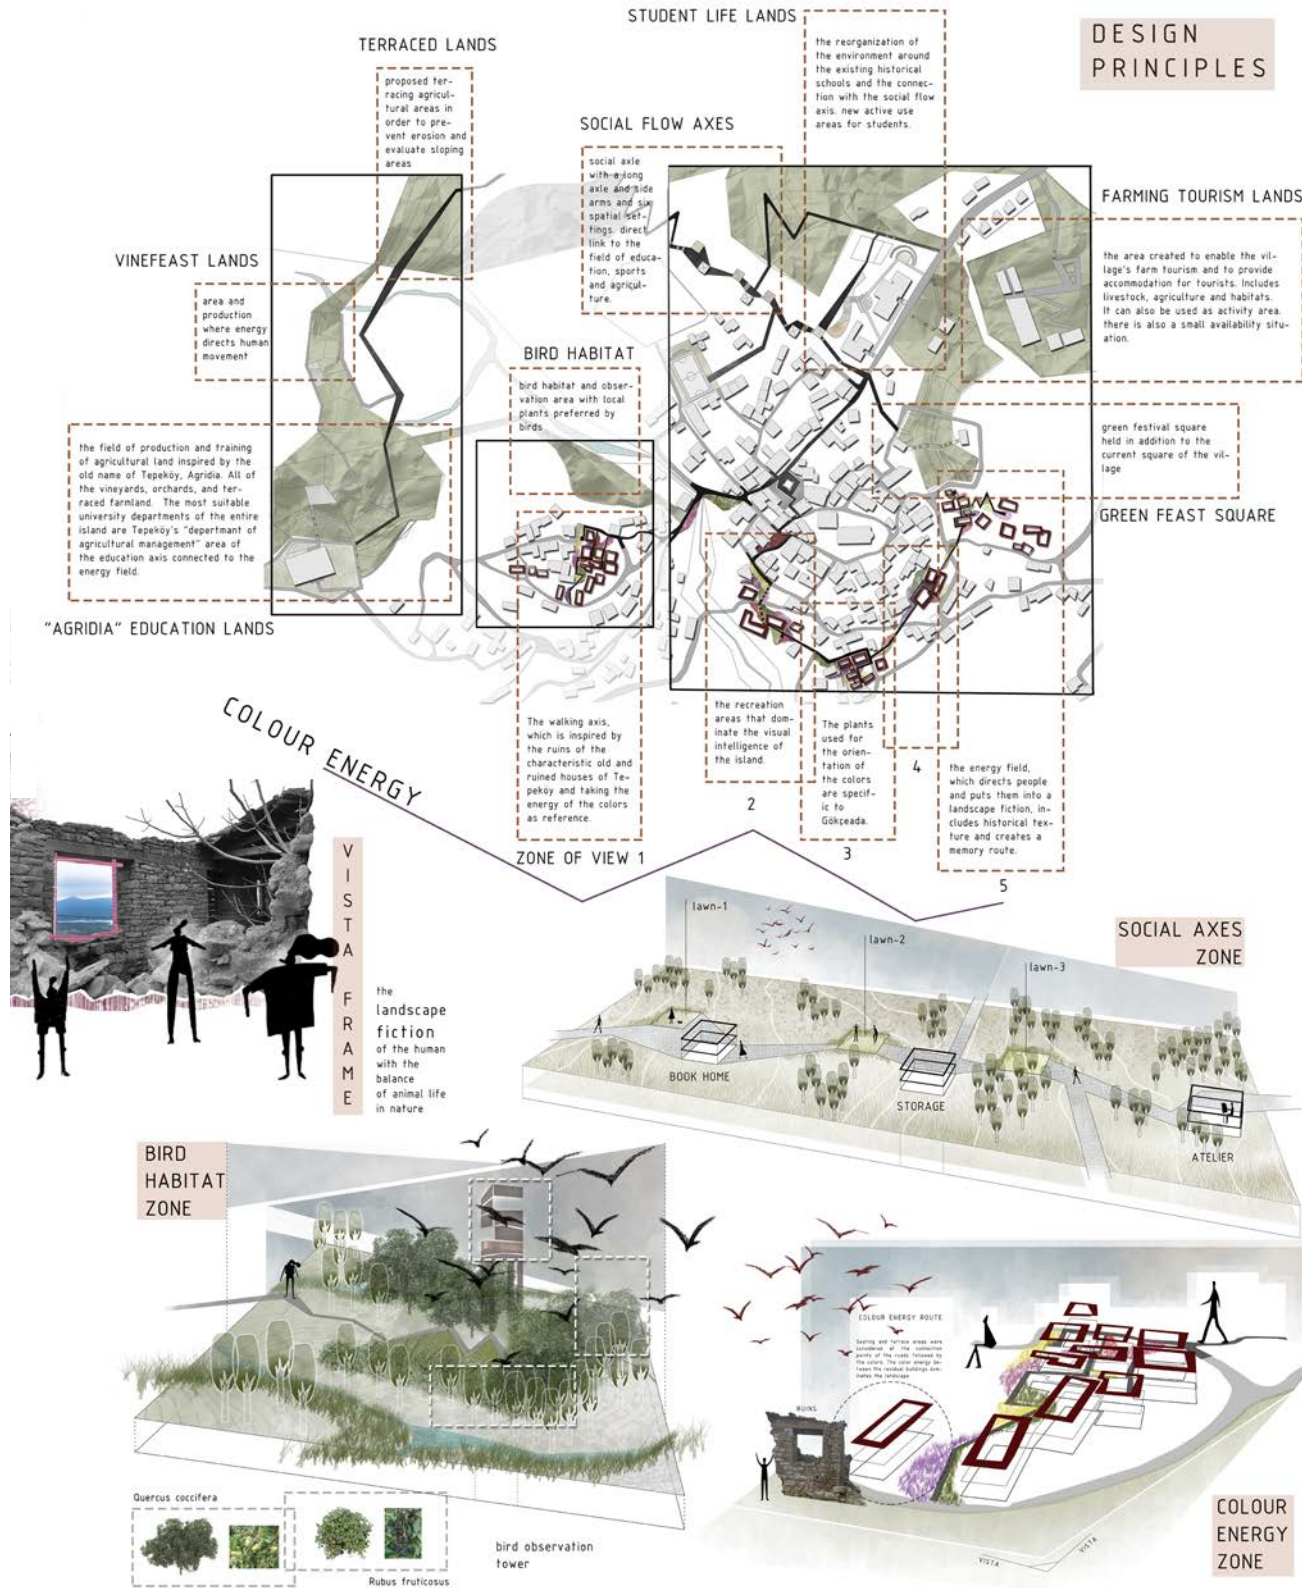

Gökçeada, a district of Turkey's Çanakkale province, holds a unique cultural, social, and economic dynamic. With its rich natural landscapes and vibrant local traditions, the island becomes a focal point, especially in summer, attracting visitors through its festivals and ecological diversity. Along the coastline, high-potential tourism activities thrive, drawing numerous visitors who

come to observe its unique fauna and natural beauty. One of the primary objectives of the Istanbul Technical University Landscape Architecture graduation project is to analyze and reimagine Gökçeada through the lens of sustainable tourism. Extensive island-wide analyses have revealed that tourism is largely concentrated along the

coast, leading to seasonal vitality limited to the summer months. To create a more balanced and year-round tourism economy, potential inland areas must be developed to maintain their appeal during winter as well. In this transformation, the traditional "sea, sand, sun" tourism model is being redefined through the new framework of "flow, soil, energy."

At a more localized scale, Tepeköy—one of the island's villages—has been identified as a key site for integrating these new concepts. Here, the principles of flow, soil, and energy are translated into practical design interventions aimed at revitalizing the village. A central focus is on harnessing both tangible and intangible energy sources, leading to the development of innovative concepts related to sustainable

resources, social interaction, and local economic growth. The project envisions Tepeköy as a year-round destination, offering employment opportunities and social spaces for residents across all seasons. To enhance tourism in the village, a “Color Energy” route has been designed, featuring local and vibrant plant species that celebrate the island’s ecological richness. The spatial connections and

design decisions made at the village level align seamlessly with broader strategies implemented across Gökçeada, ensuring a cohesive and sustainable tourism vision. Ultimately, the Gökçeada Sustainable Tourism Project has been strategically planned to promote an inclusive and balanced lifestyle, fostering expansion and continuity in tourism while preserving the island's cultural and ecological integrity.

Genius Loci: Shinudi

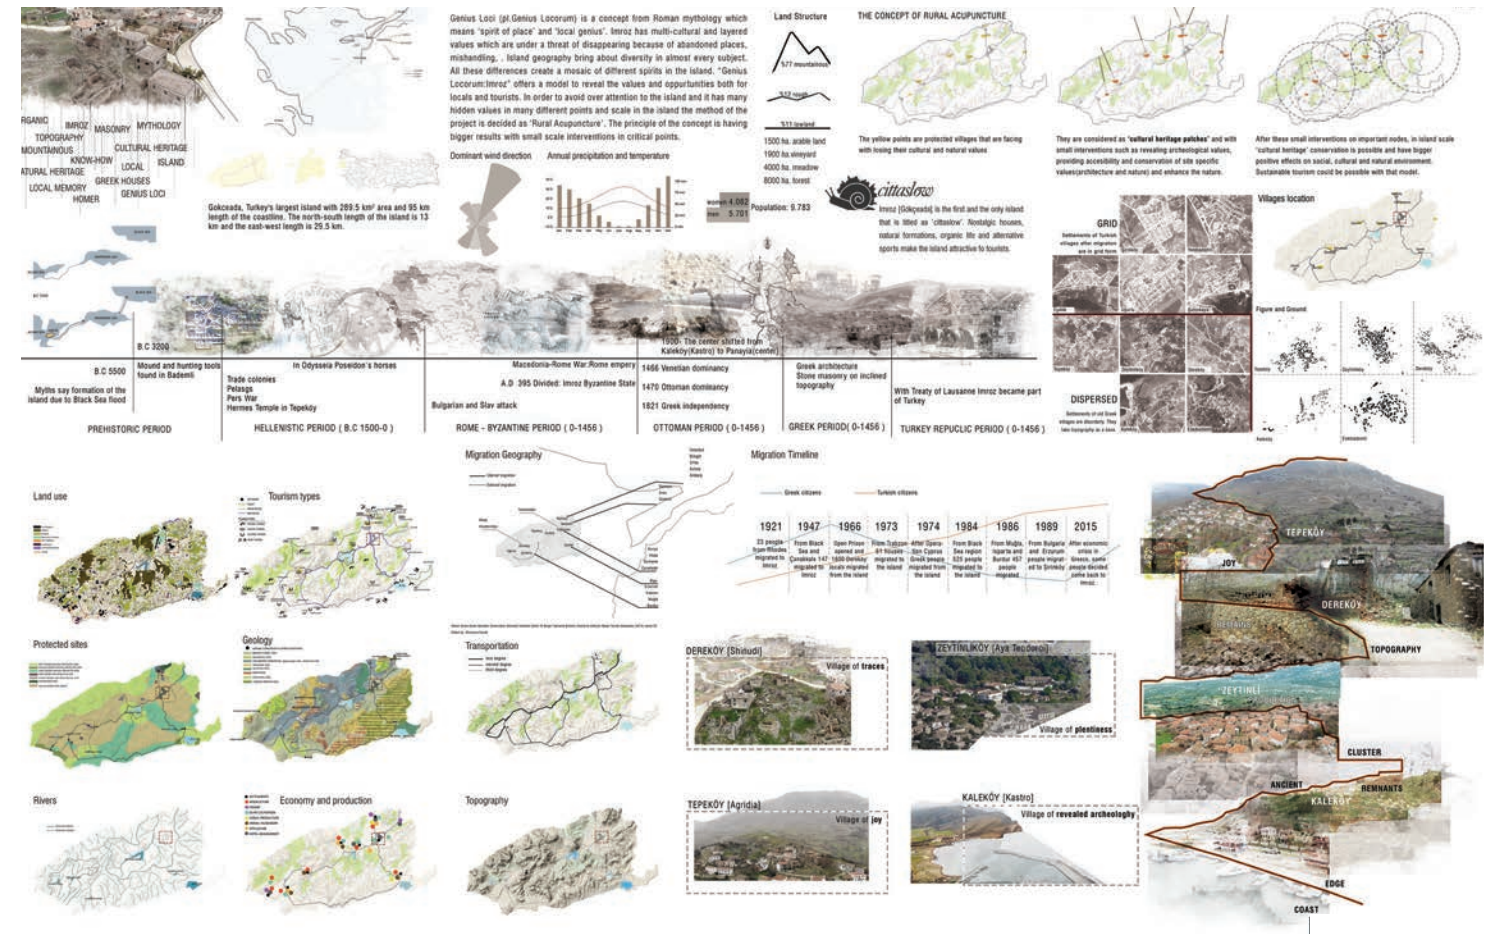

Rümeysa Konuk

"Genius Loci: Shinudi" was produced within the scope of Graduation Project carried out by Prof. Dr. Meltem Erdem Kaya, Prof. Dr. F. Ayçim Türer Başkaya, Assist.Prof. Dr. Muhammed Ali Örnek, Assoc. Prof. Dr. Melih Bozkurt, M.Sc. Land Arch. Arzu Nuhoğlu, and Lecturer. Dr. Gökçer Okumuş and assisted by Res. Assist. Elif Serdar Yakut and Res. Assist. Merve Aydınlı under the title "Gökçeada - On the Track of Cultural Continuity Greek Villages" in the spring semester of 2018-2019.

* TMMOB Chamber of Landscape Architects • 8th Landscape Architecture Students Graduation Project Awards
Equivalent Award

2018-2019 Spring

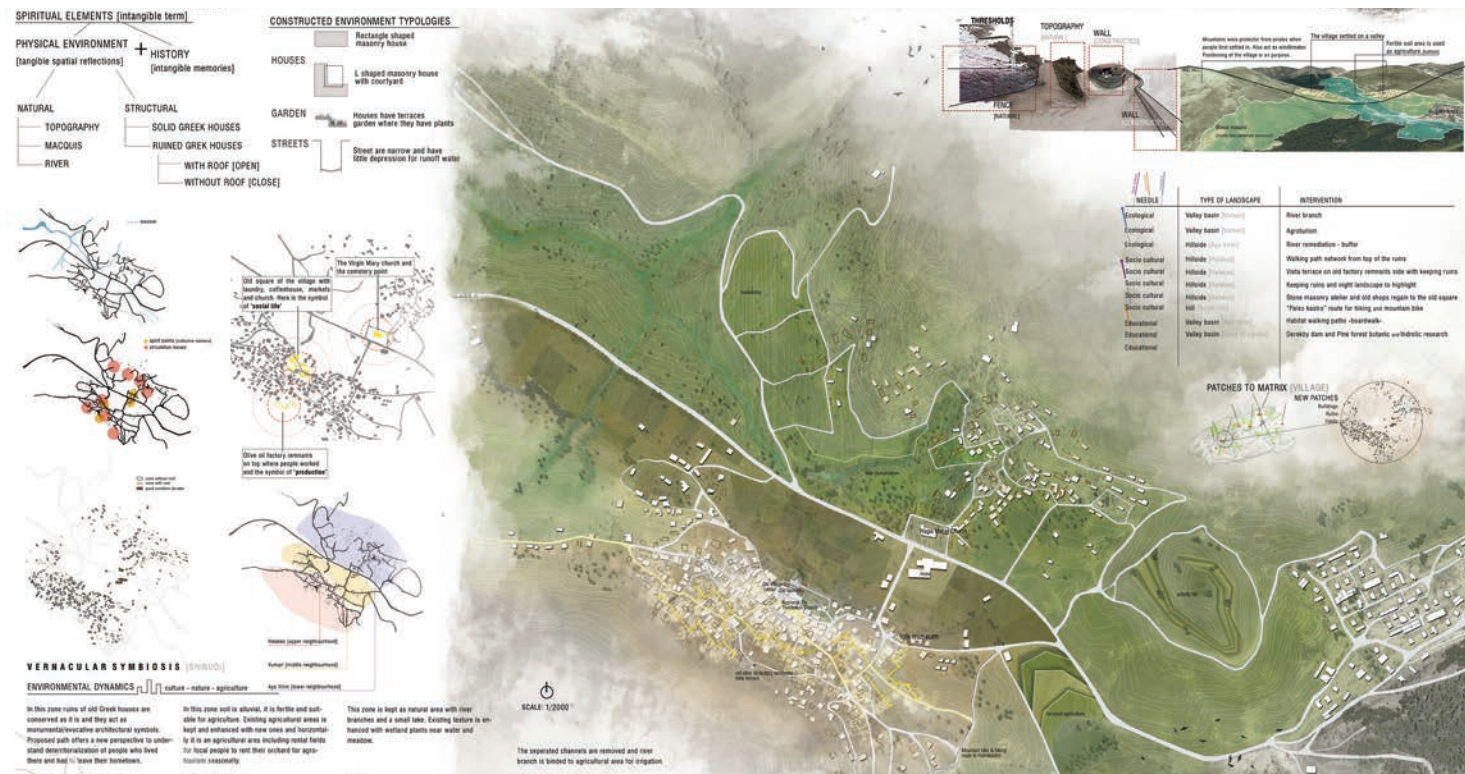

The concept of Genius Loci, originating from Roman mythology, refers to the “spirit of place” and the unique identity of a location. Imroz possesses a rich, multi-layered cultural heritage, yet its identity is increasingly at risk due to abandonment and mismanagement. To address this challenge without causing further disruption or overexposure, the project adopts the Rural Acupuncture

method. This approach aims to achieve significant results through small-scale, strategic interventions at critical points, preserving the island's intrinsic values while fostering sustainable revitalization. The Rural Acupuncture method introduces various tourism models that balance the island's diverse cultural and environmental dynamics. At the island scale, three acupuncture interventions have been

proposed, each targeting a distinct aspect of Gökçeada's heritage: socio-cultural interventions, educational interventions, ecological interventions. These intervention "needles" work in harmony with existing tourism activities, such as coastal tourism, cultural tourism, nature-based tourism, and sports tourism, ensuring a holistic and sustainable approach to development.

DESIGN PROCESS

Elements of 'Genius Loci'

- Historical: Paleokastro, Mills, Olive oil factory, Coffeehouse
- Socio-cultural: Church, Laundry, Old square
- Agricultural: Agriculture

2 Because of the intense topography loci path [yellow] linearly defined again with existing village roads and goes in between 'genius loci points'

3 Loci platform provides spirit points accessible and reveal in order to sustain cultural heritage. It attaches genius loci path or protected village streets

TOPOGRAPHICAL STRATEGIES

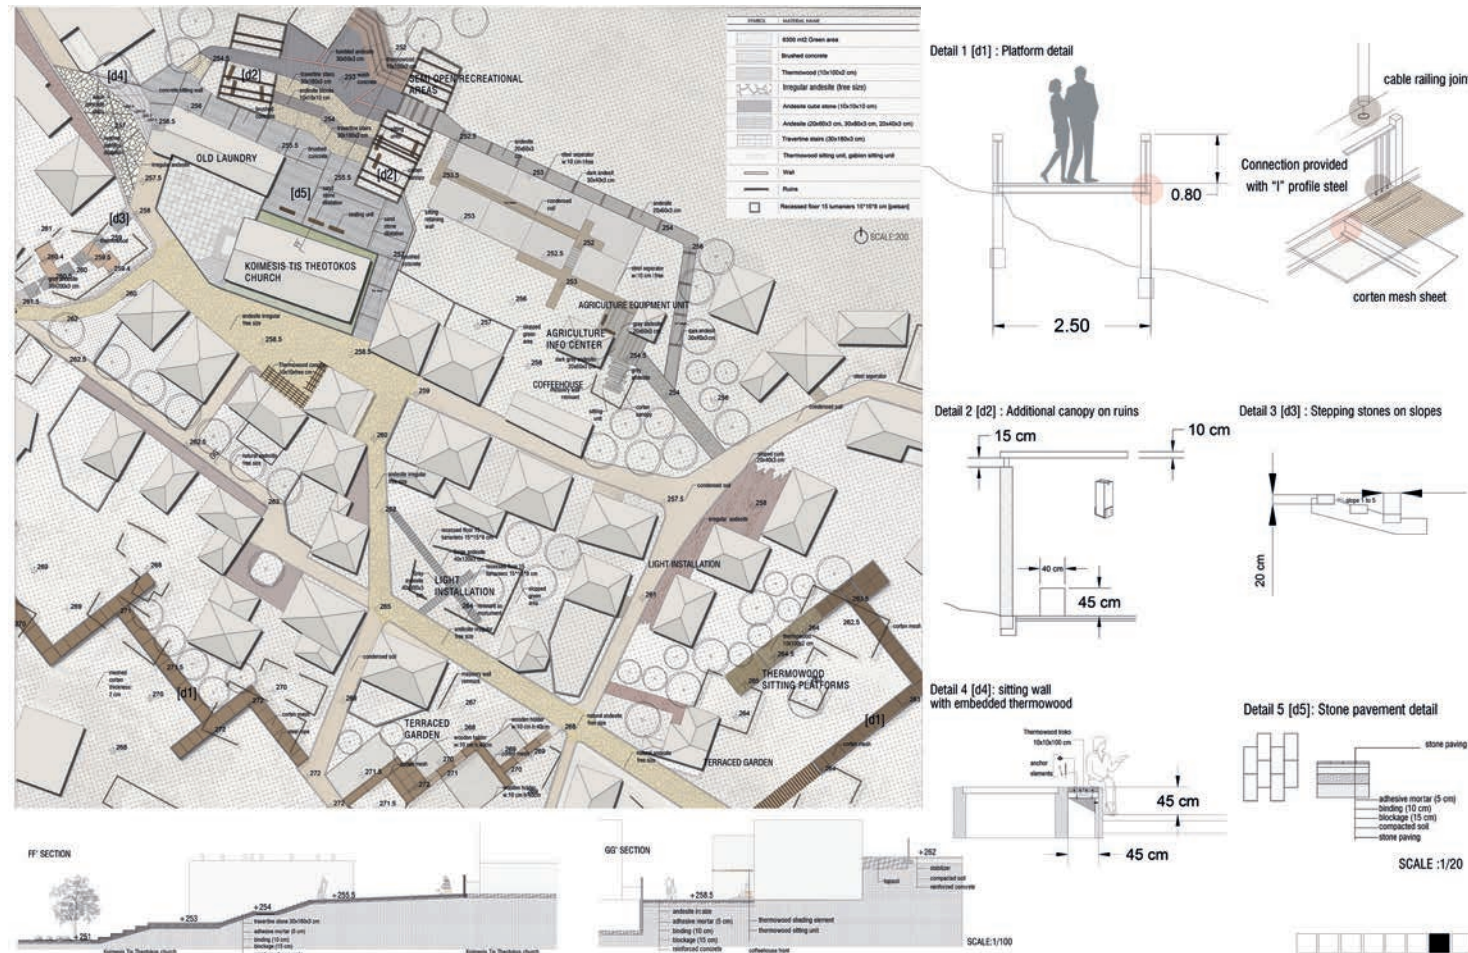

At a more localized scale, the village of Dereköy (Shinudi) is reimagined through three thematic lenses: Culture, Agriculture, and Nature. The village's history of abandonment has led to an organic transformation, where the ruins of old structures have merged with the surrounding topography, creating a distinct landscape. However, rather than evoking the memory of old Shinudi, this evolving texture primarily conveys feelings of abandonment and melancholy. Beyond physical presence in the landscape, the experience of viewing the site from a

distance or from elevated perspectives enhances visitors' awareness and emotional engagement. The spatial relationships between the ruins are reflected in the proposed grid platform system, which extends into the vertical plane through sectional repetition. A key feature of the design is the Memory Path, which serves as the primary connector within the grid system. Extending from the village entrance in the east to its exit in the west, this path ensures a coherent and traceable narrative through the site. Several significant historical elements shape the spirit of the

intervention, including: Paleokastro (Old Castle), ruins of historic mills, remnants of an olive oil factory, the old coffeehouse. Additionally, the church, laundry, and old shops located in the former village square have been repurposed into socio-cultural and agricultural spaces within the valley basin. These key landmarks act as acupuncture points within the village, working in tandem with the Memory Path and grid platforms to reinforce a sense of continuity and place.

"Diasporal Arcadia" was produced within the scope of Graduation Project carried out by Prof. Dr. Meltem Erdem Kaya, Prof. Dr. F. Ayçim Türer Başkaya, Assist.Prof. Dr. Muhammed Ali Örnek, Assoc. Prof. Dr. Deniz Aslan, and Lecturer. Dr. Gökçer Okumuş and assisted by Res. Assist. Elif Serdar Yakut and Res. Assist. Nergis Aşar under the title "Pollinate " in the spring semester of 2019-2020.

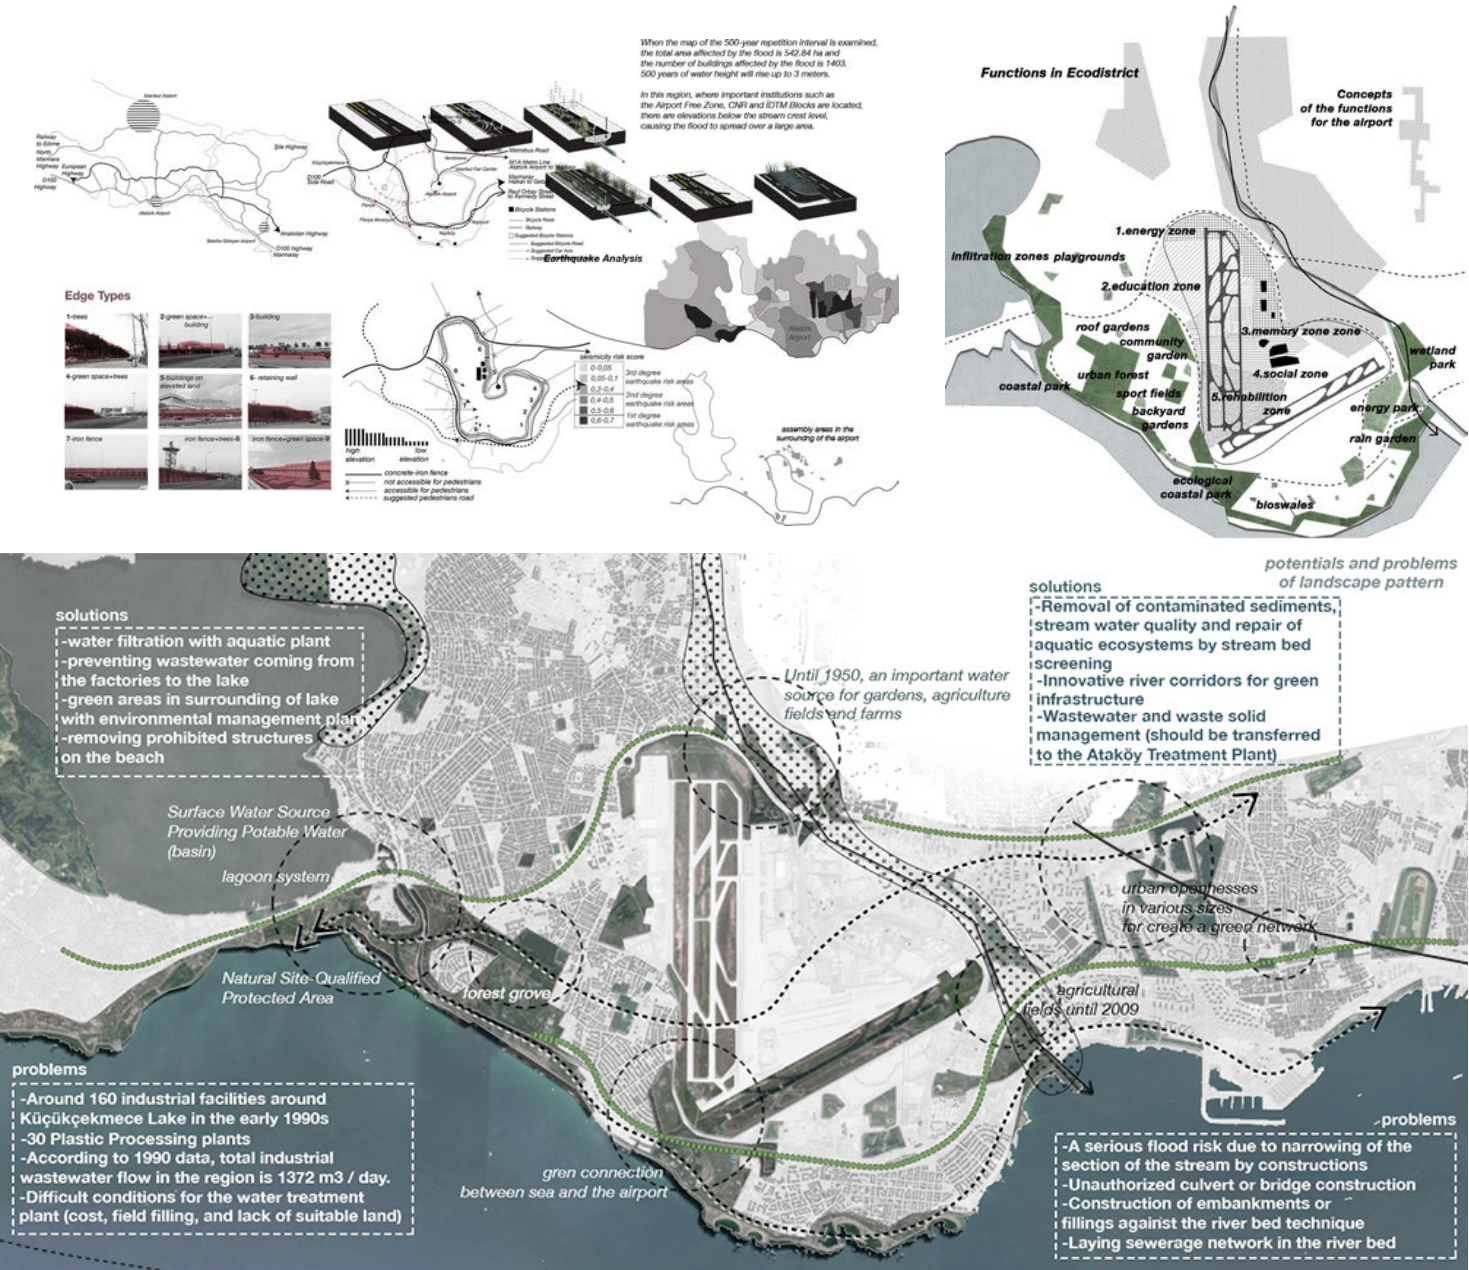

480

This project envisions landscape as a metaphor for an airport, aiming to redefine and sustain the sense of place, support cultural memory, establish a balance between local and regional dynamics, and integrate both globalization and localization through functional design. By transforming Atatürk Airport into a productive landscape, the project also creates

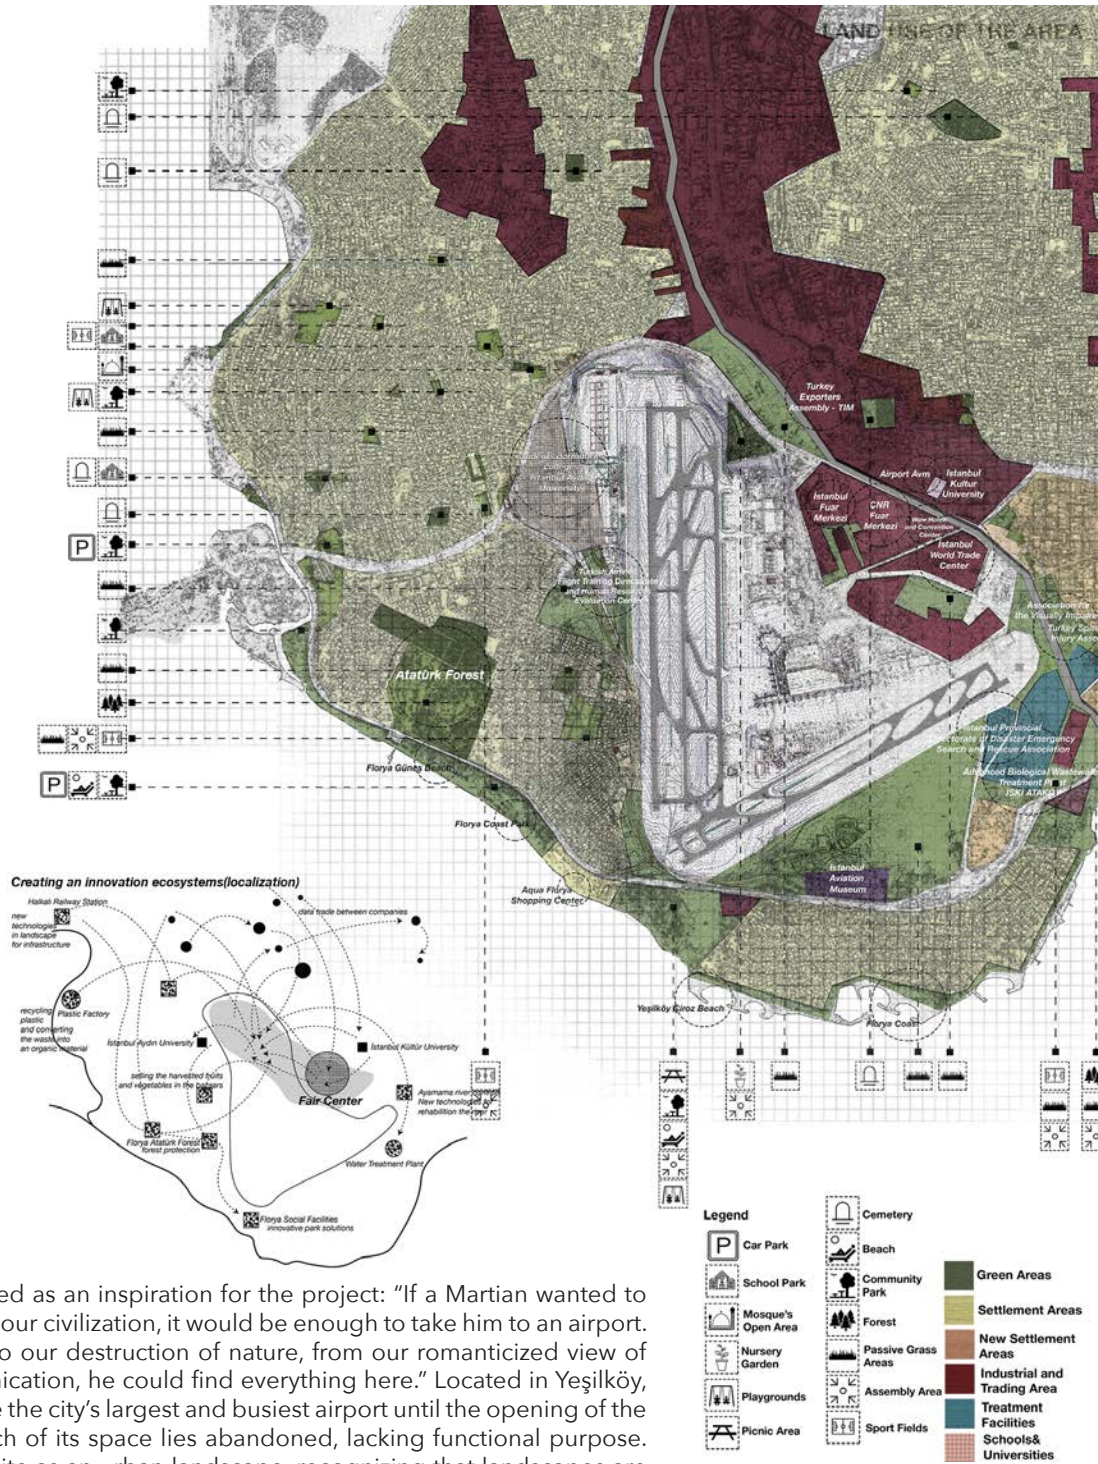

opportunities for collective engagement among local communities. Atatürk Airport, built in 1912 in Istanbul, was a milestone in the city's technological development. Any new landscape proposal for this area must embrace innovation and act as a catalyst for future urban transformations. The concept of ecodistricts plays a central role in this vision, emphasizing sustainable

development, social equity, and a reduced ecological footprint. This approach considers environmental challenges through a collaborative, systematic process, integrating both technological and social strategies to create a sustainable urban framework.

Timeline of Atatürk Airport

481

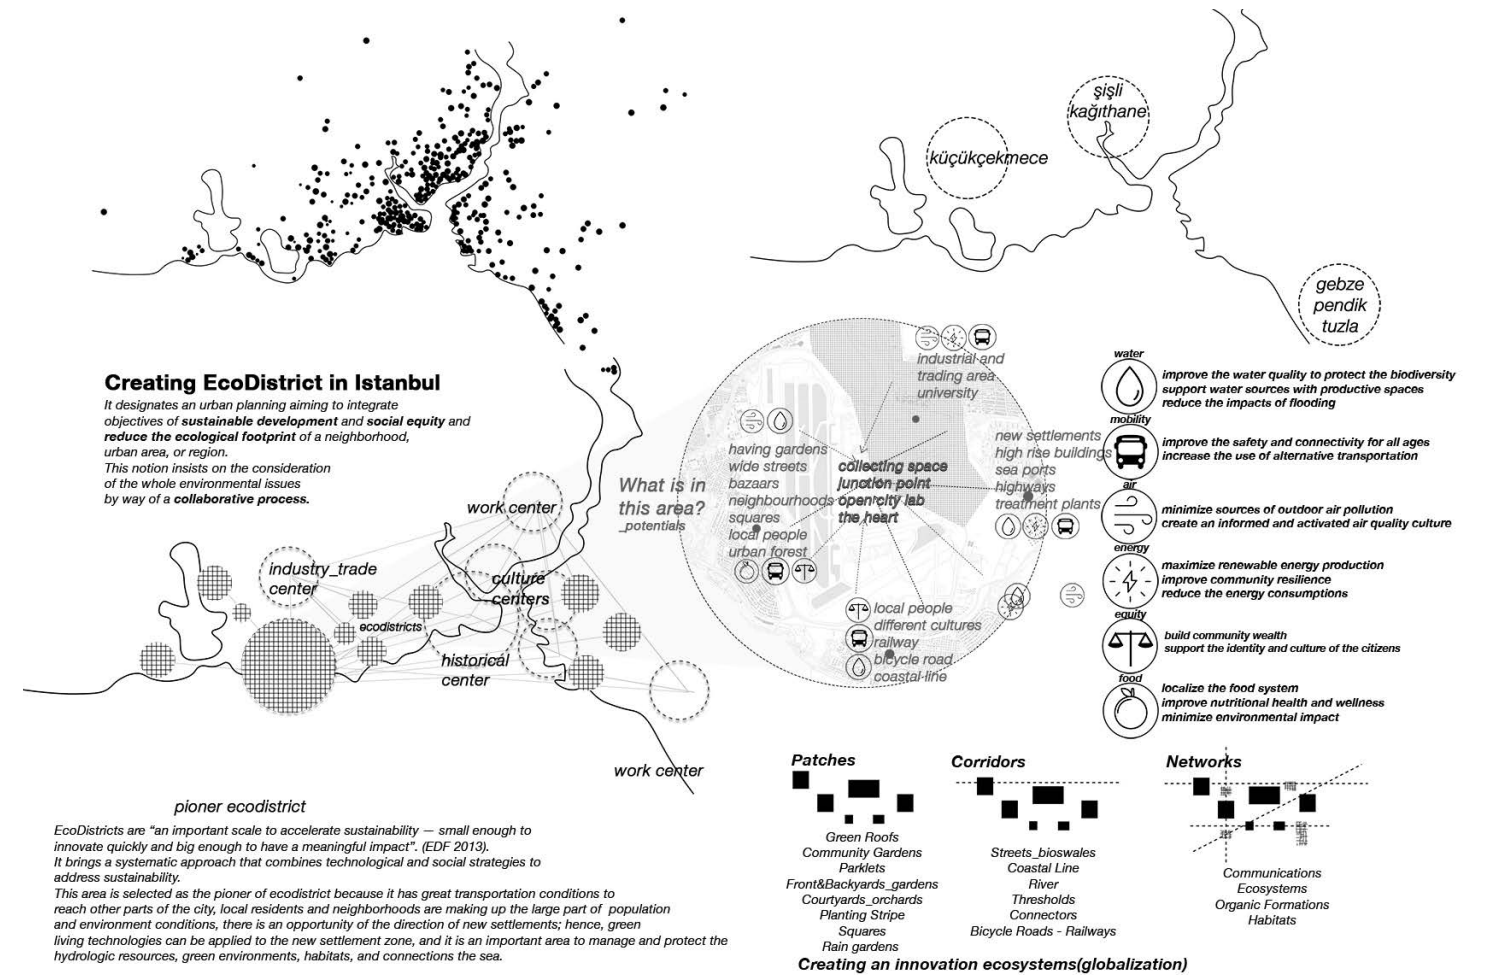

A quote by Alain de Botton served as an inspiration for the project: "If a Martian wanted to visit a single place to get to know our civilization, it would be enough to take him to an airport. From our loyalty to technology to our destruction of nature, from our romanticized view of travel to our patterns of communication, he could find everything here." Located in Yeşilköy, Istanbul, Atatürk Airport was once the city's largest and busiest airport until the opening of the new Istanbul Airport. Today, much of its space lies abandoned, lacking functional purpose. This project aims to reclaim the site as an urban landscape, recognizing that landscapes are inherently dynamic, flexible, and living systems. However, within the urban fabric, the airport acted as a catalyst for development, influencing the expansion of surrounding settlements. Before the airport was constructed, the area was primarily agricultural land. Over time, the airport's presence accelerated urbanization, leading to the replacement of farmland with housing and infrastructure.

The airport, as a product of globalization and modernization, functioned as both a connector between local and global dynamics and a disruptor of natural systems. This transformation highlights the need for an ecodistrict strategy, which seeks to integrate sustainability into urban planning while restoring ecological balance. The site's strategic location and accessibility make it an ideal pioneer for Istanbul's ecodistrict movement. Key factors include: excellent transportation connections to the rest of the city, a diverse

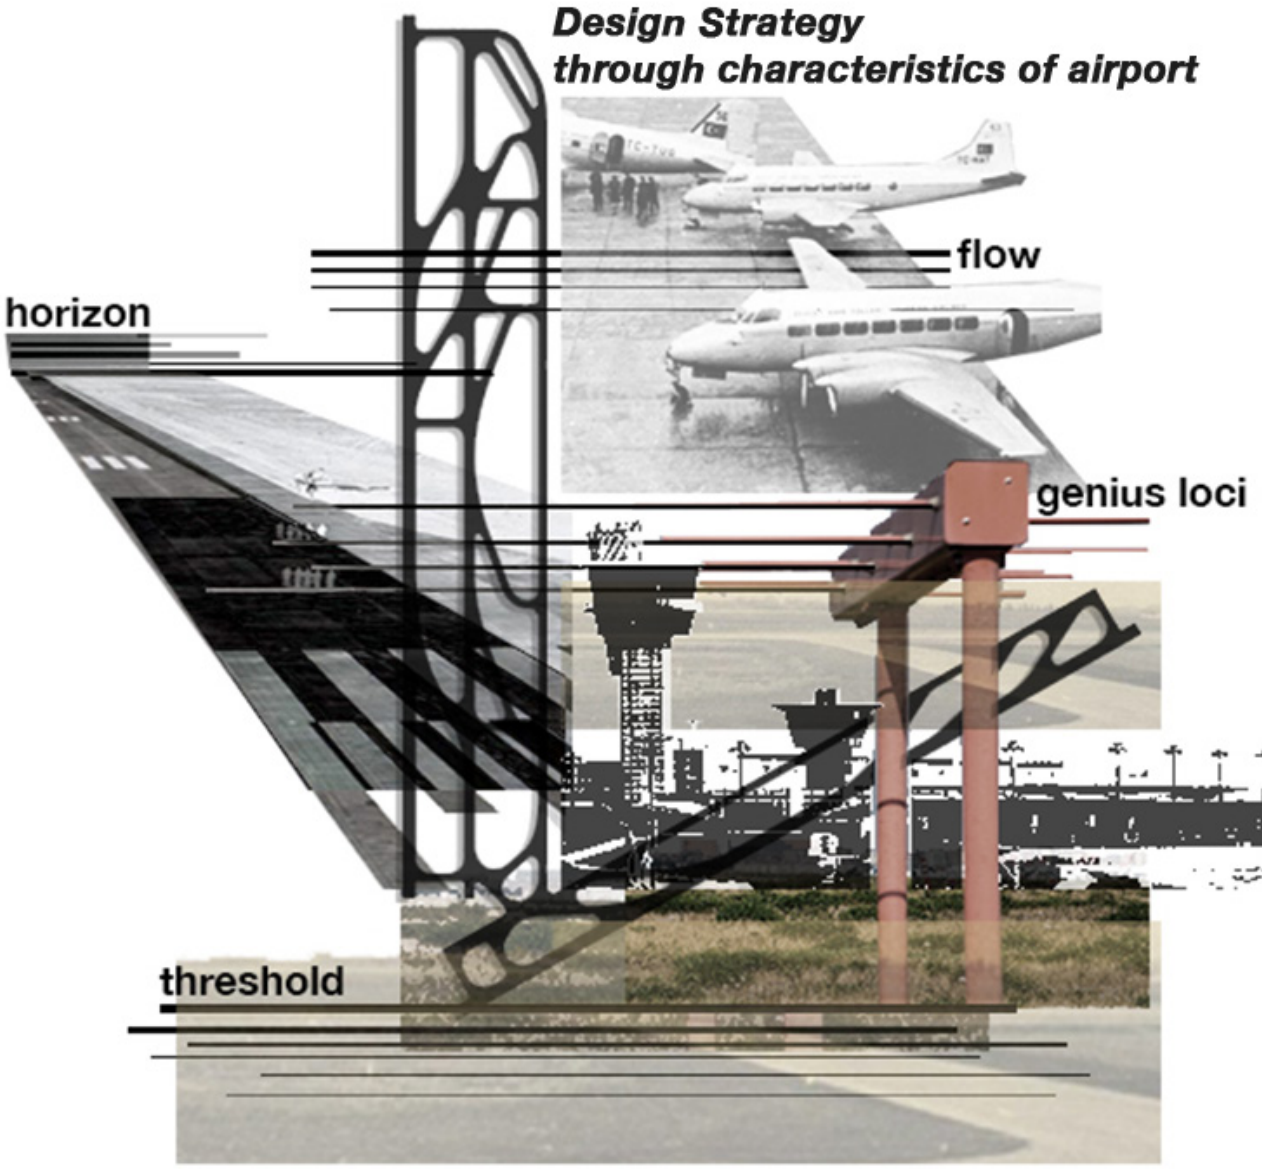

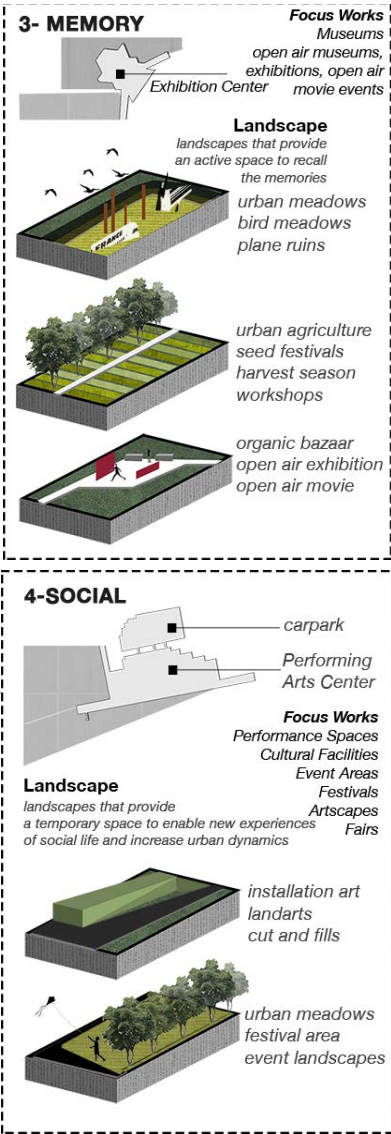

local population, providing a strong social fabric for engagement, opportunities for sustainable urban development, including green technologies, existing infrastructure that can be repurposed for education, research, and social activities.

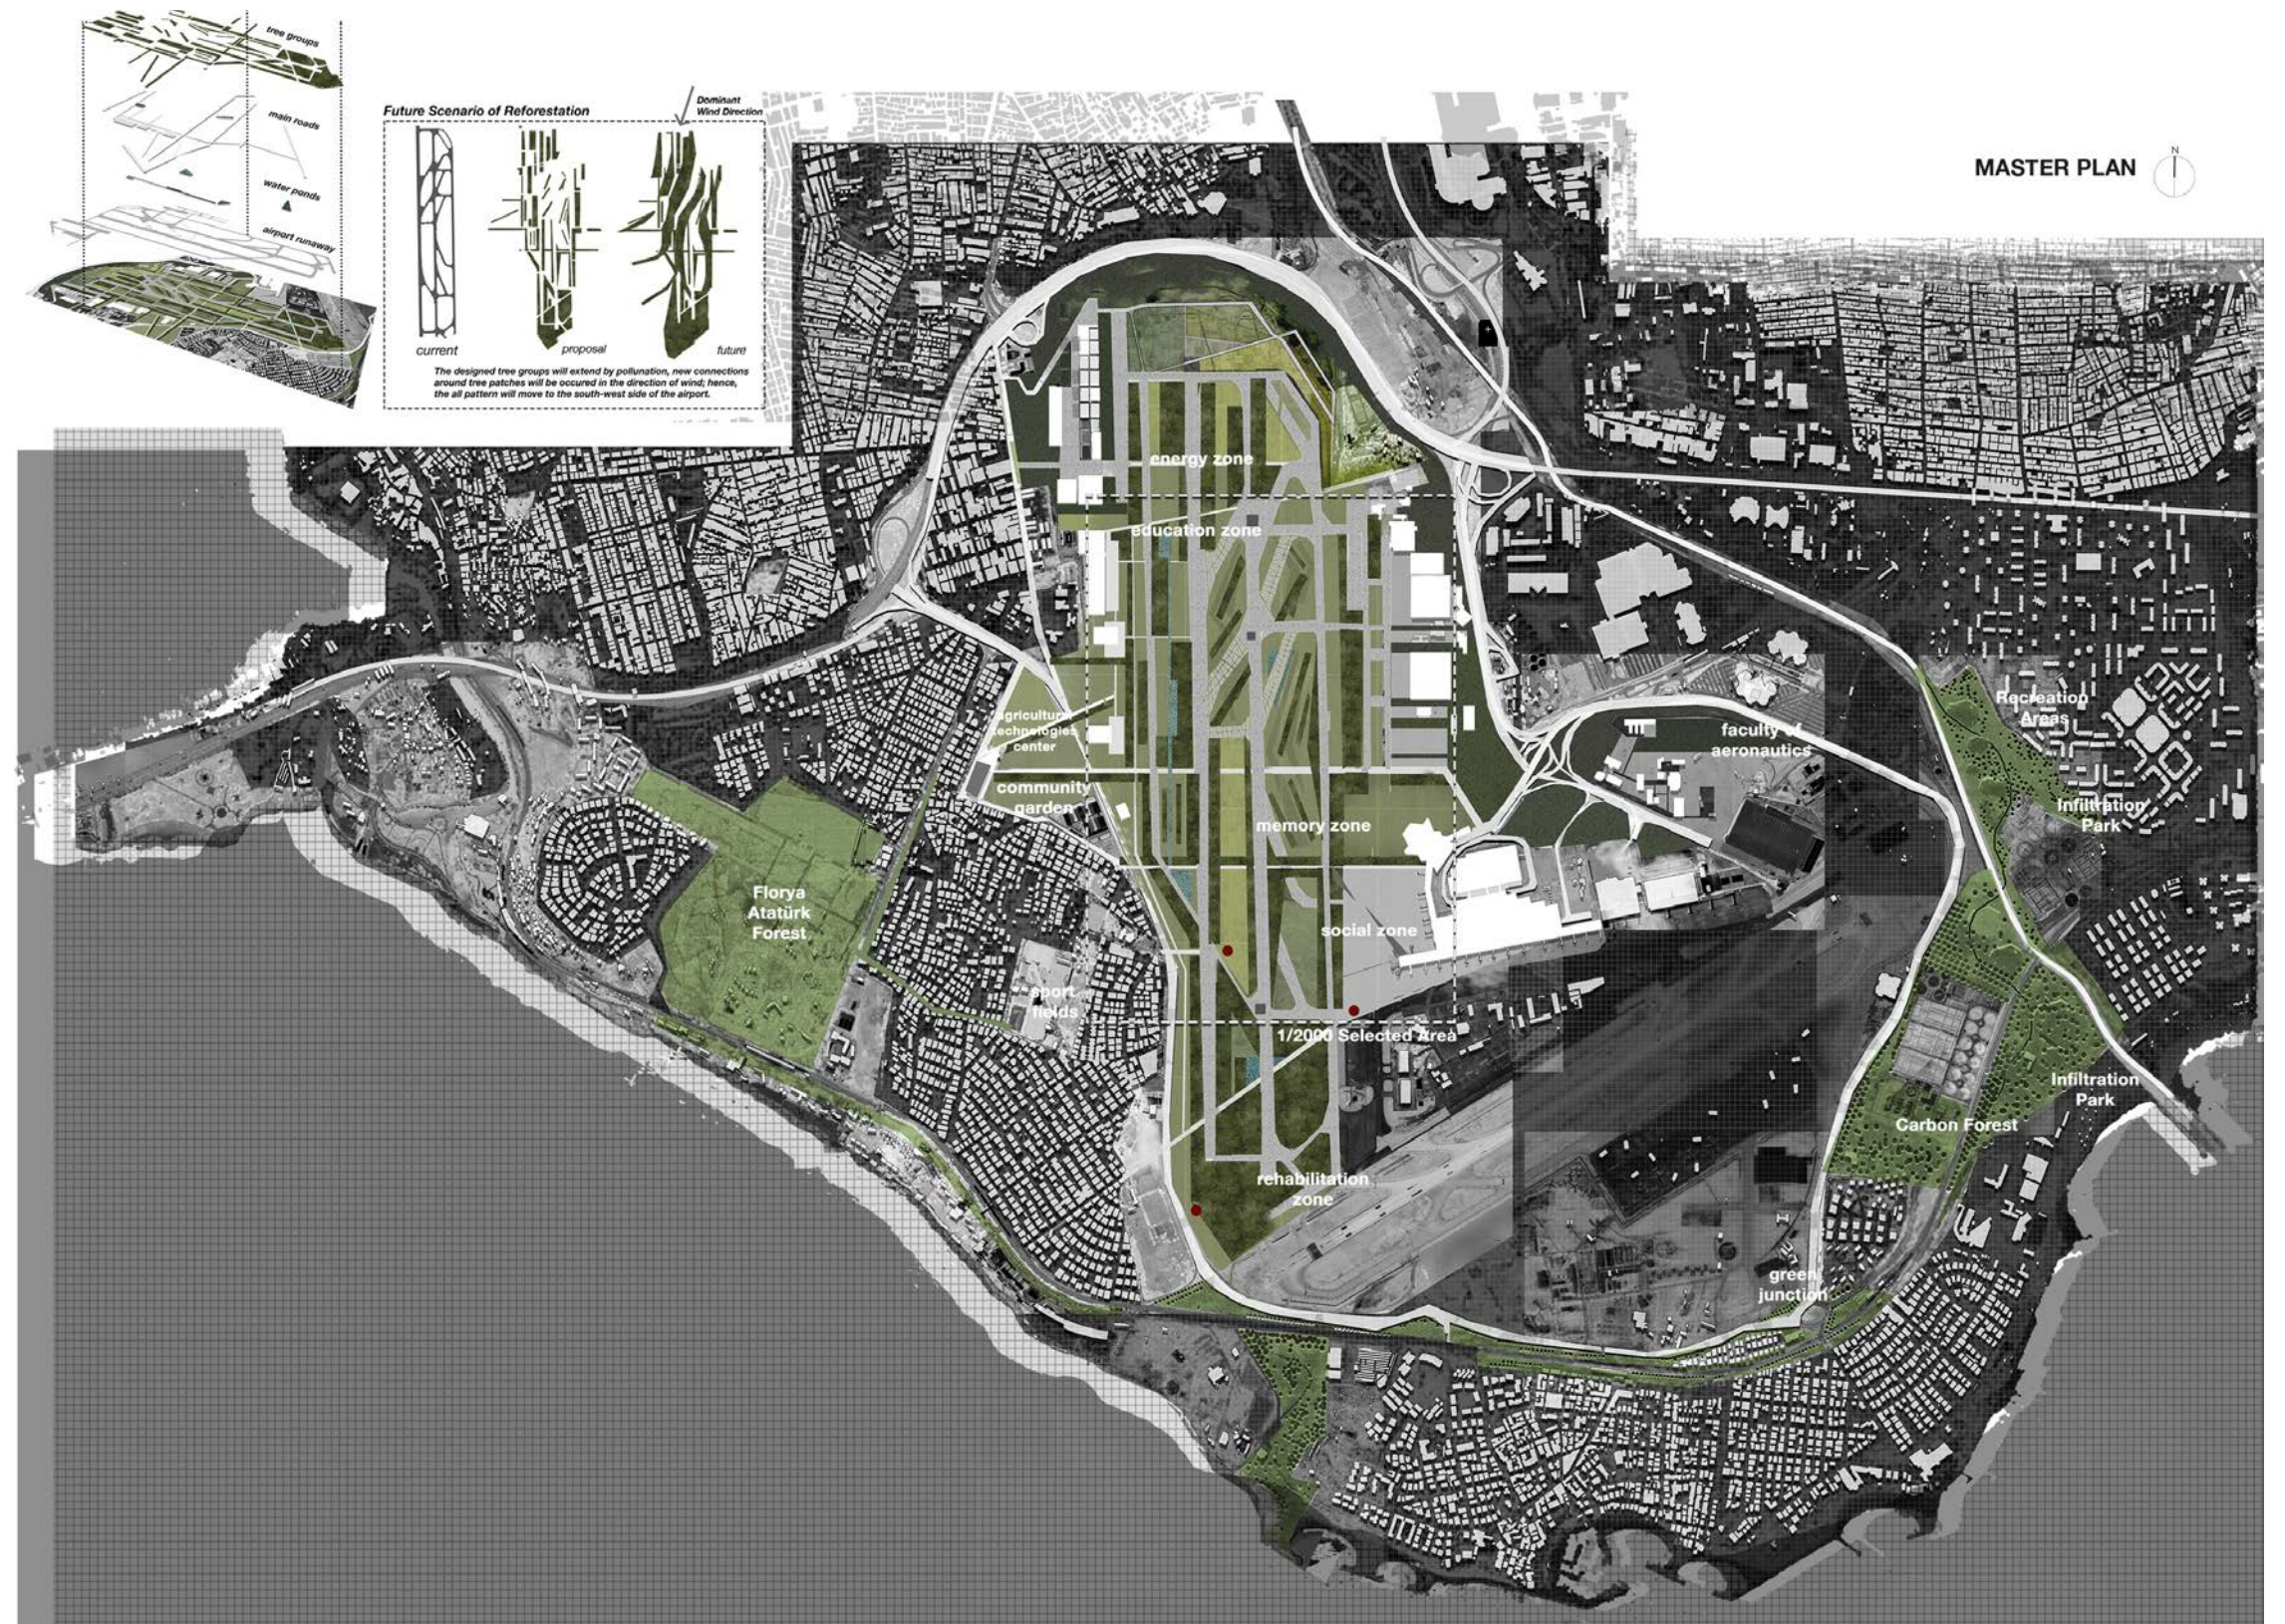

By leveraging these strengths, the project aims to transform the airport site into a model for sustainable urban regeneration. The reforestation strategy draws inspiration from the historical movement of settlements following the airport's construction. As the

airport expanded, agricultural fields were absorbed, leading to a shift in land use. This movement is metaphorically translated into tree formations, where man-made tree clusters with sharp edges will be introduced across the site. These clusters will vary in size and species, fostering relationships through pollination. Additionally, ground ditches will be implemented as traces for seed planting, allowing for an observable process of ecological succession from the beginning.

The project focuses on cultural, social, ecological, and economic connections, ensuring a holistic transformation of the site. As Istanbul's first ecodistrict, it seeks to raise awareness about the importance of preserving and sustaining natural and cultural resources in the 21st century. To achieve this, underutilized and passive spaces within the surrounding urban fabric will be converted into productive or recreational landscapes, utilizing innovative technologies and community-driven initiatives. The project particularly emphasizes collaboration between: students, elderly local residents, people from diverse cultural backgrounds, scientists and researchers, investors and engineers.

The design is structured around five key zones, each addressing different aspects of sustainability and urban function:

Energy Zone - Home to research centers and laboratories focused on renewable energy and sustainability.
Education Zone - Universities and open spaces dedicated to environmental education and knowledge-sharing.

Memory Zone - Includes urban agricultural fields, an open-air museum, and event spaces that highlight the history and cultural significance of the airport.
Social Zone - A vibrant hub for community gatherings, concerts, and exhibitions, fostering social interaction.
Rehabilitation Zone - The core reforestation area, where ecological restoration begins and evolves over time.

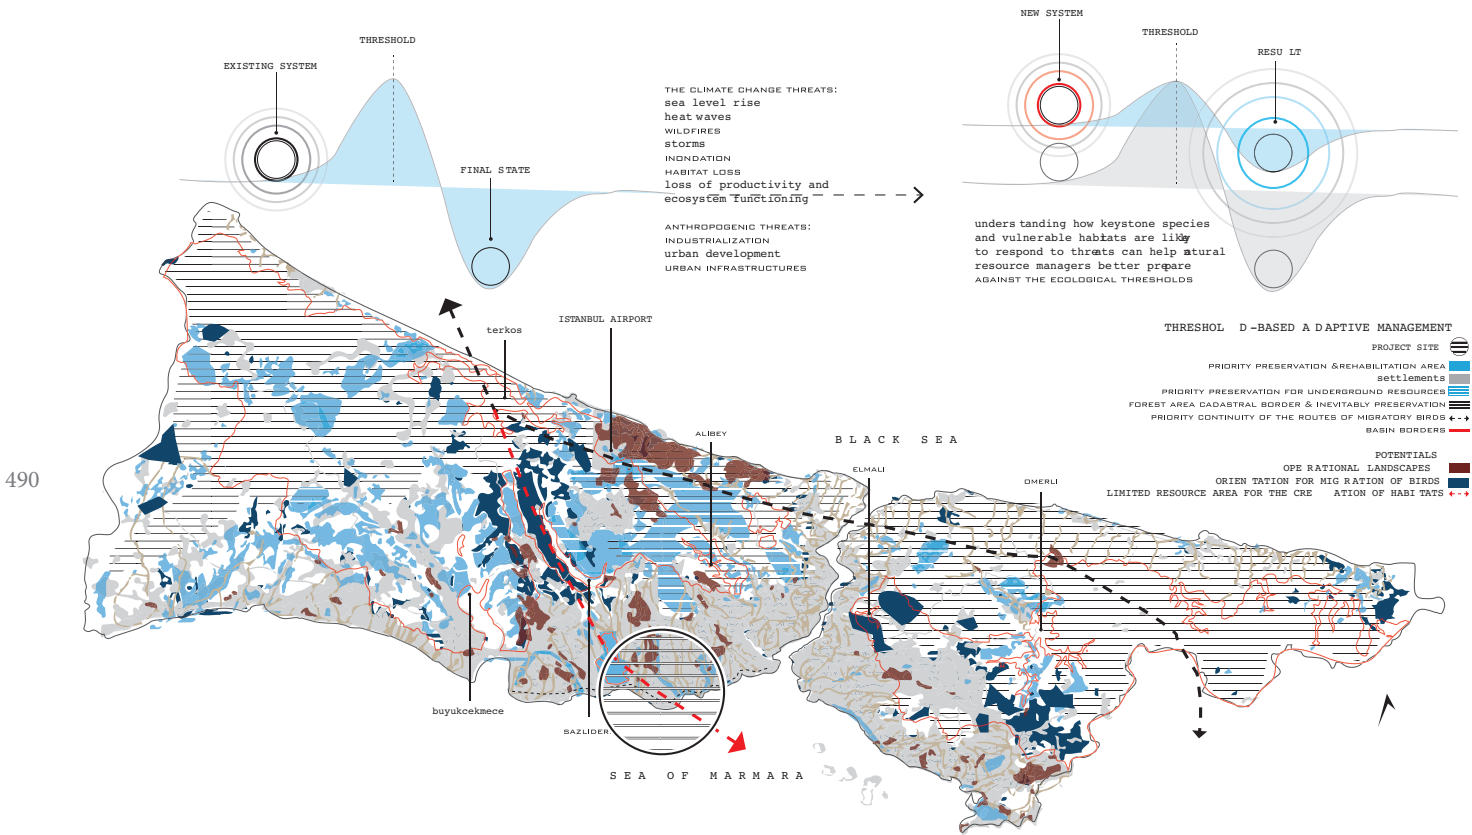

By transforming Atatürk Airport into an ecodistrict, the project not only reclaims abandoned urban land but also sets a precedent for sustainable urban development in Istanbul. Through a balance of cultural memory, ecological restoration, and social innovation, this vision redefines the airport as a dynamic, future-oriented landscape that fosters both local engagement and global connectivity.

Data Istanbul

Duygu Durmaz

“Data Istanbul” was produced within the scope of Graduation Project carried out by Prof. Dr. Meltem Erdem Kaya, Prof. Dr. F. Ayçim Türer Başkaya, Assist.Prof. Dr. Muhammed Ali Örnek, Assoc. Prof. Dr. Deniz Aslan, and Lecturer. Dr. Gökçer Okumuş and assisted by Res. Assist. Elif Serdar Yakut and Res. Assist. Nergis Aşar under the title “Pollinate” in the spring semester of 2019-2020.

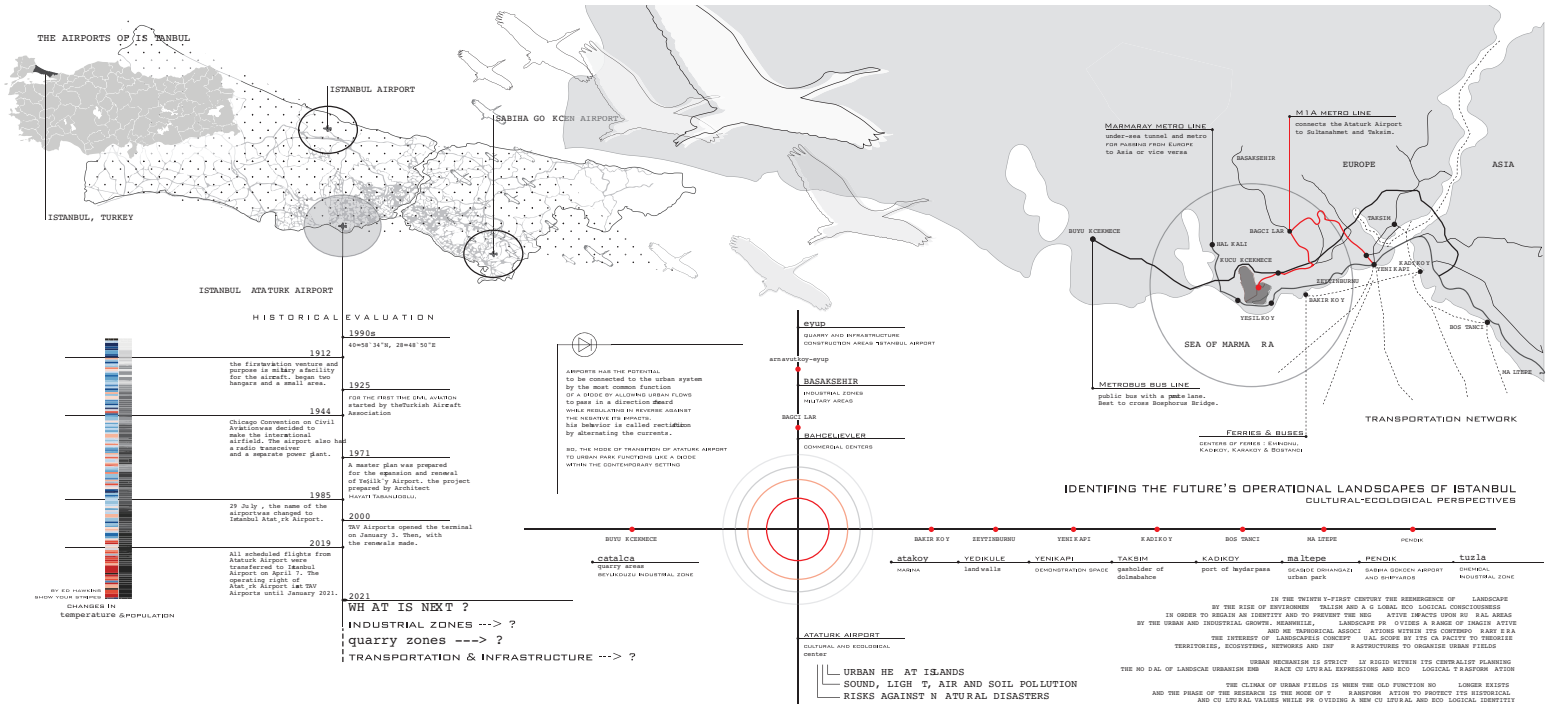

490

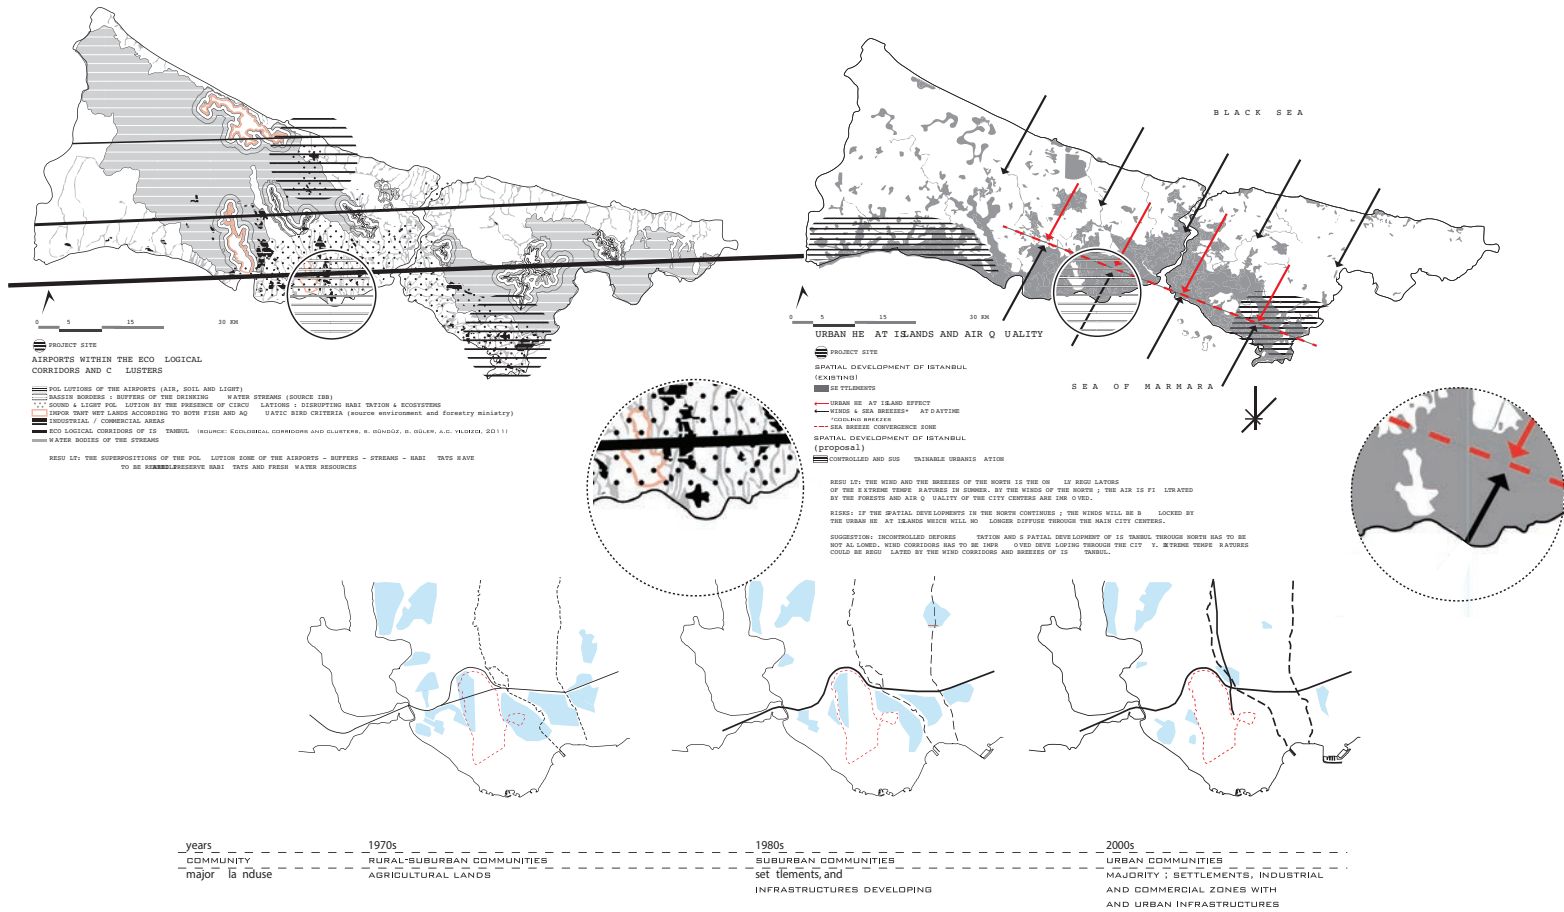

Operational landscapes serve as the keystone in shaping the transformation process of Data Istanbul, playing a crucial role in both landscape urbanization and the initiation of new ecological and cultural dynamics. By leveraging its potential as a catalyst for change, Data Istanbul fosters a new mode of transformation. At the core of this transformation is a virtual platform integrating geographical and forestry data, which enables the pollination of information on both national and international scales. This platform

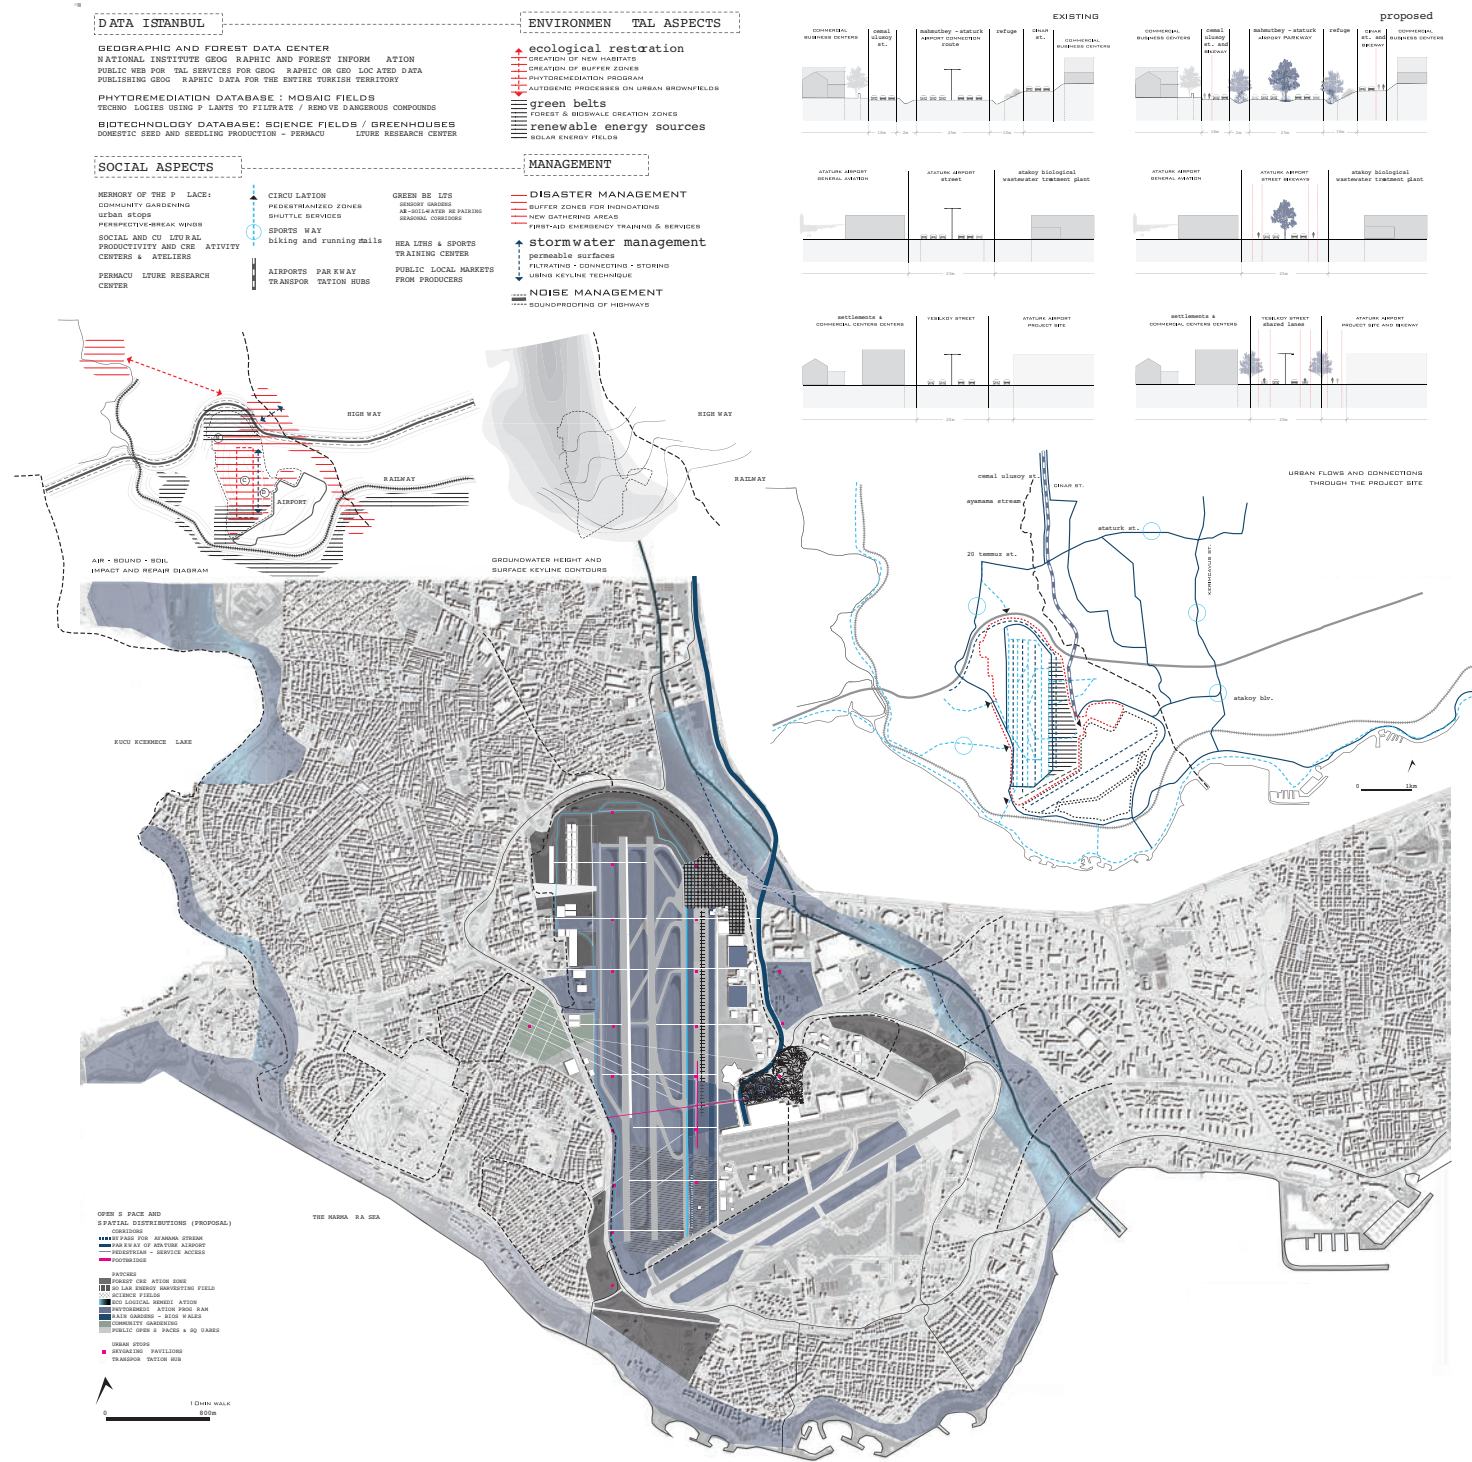

influences ecological and cultural shifts by facilitating data exchange, fostering innovation, and guiding sustainable urban development. The proposed urban landscape system is structured around three fundamental pillars: Biotechnology - Integrating scientific advancements to enhance environmental resilience. Permaculture Principles - Establishing self-sustaining, regenerative landscapes. Phytoremediation Processes - Utilizing plants to detoxify and restore ecosystems.

Data Istanbul promotes ecological restoration by prioritizing the accessibility of environmental data, allowing continuous adaptation and improvement within its ecological thresholds. By blending analytical thinking with an operational landscape approach, it seeks to establish a holistic and intellectual framework for transformation. This project envisions a metamorphosis process that emerges from the intersection of ecological and cultural landscapes, ensuring a sustainable, data-driven future for Istanbul.

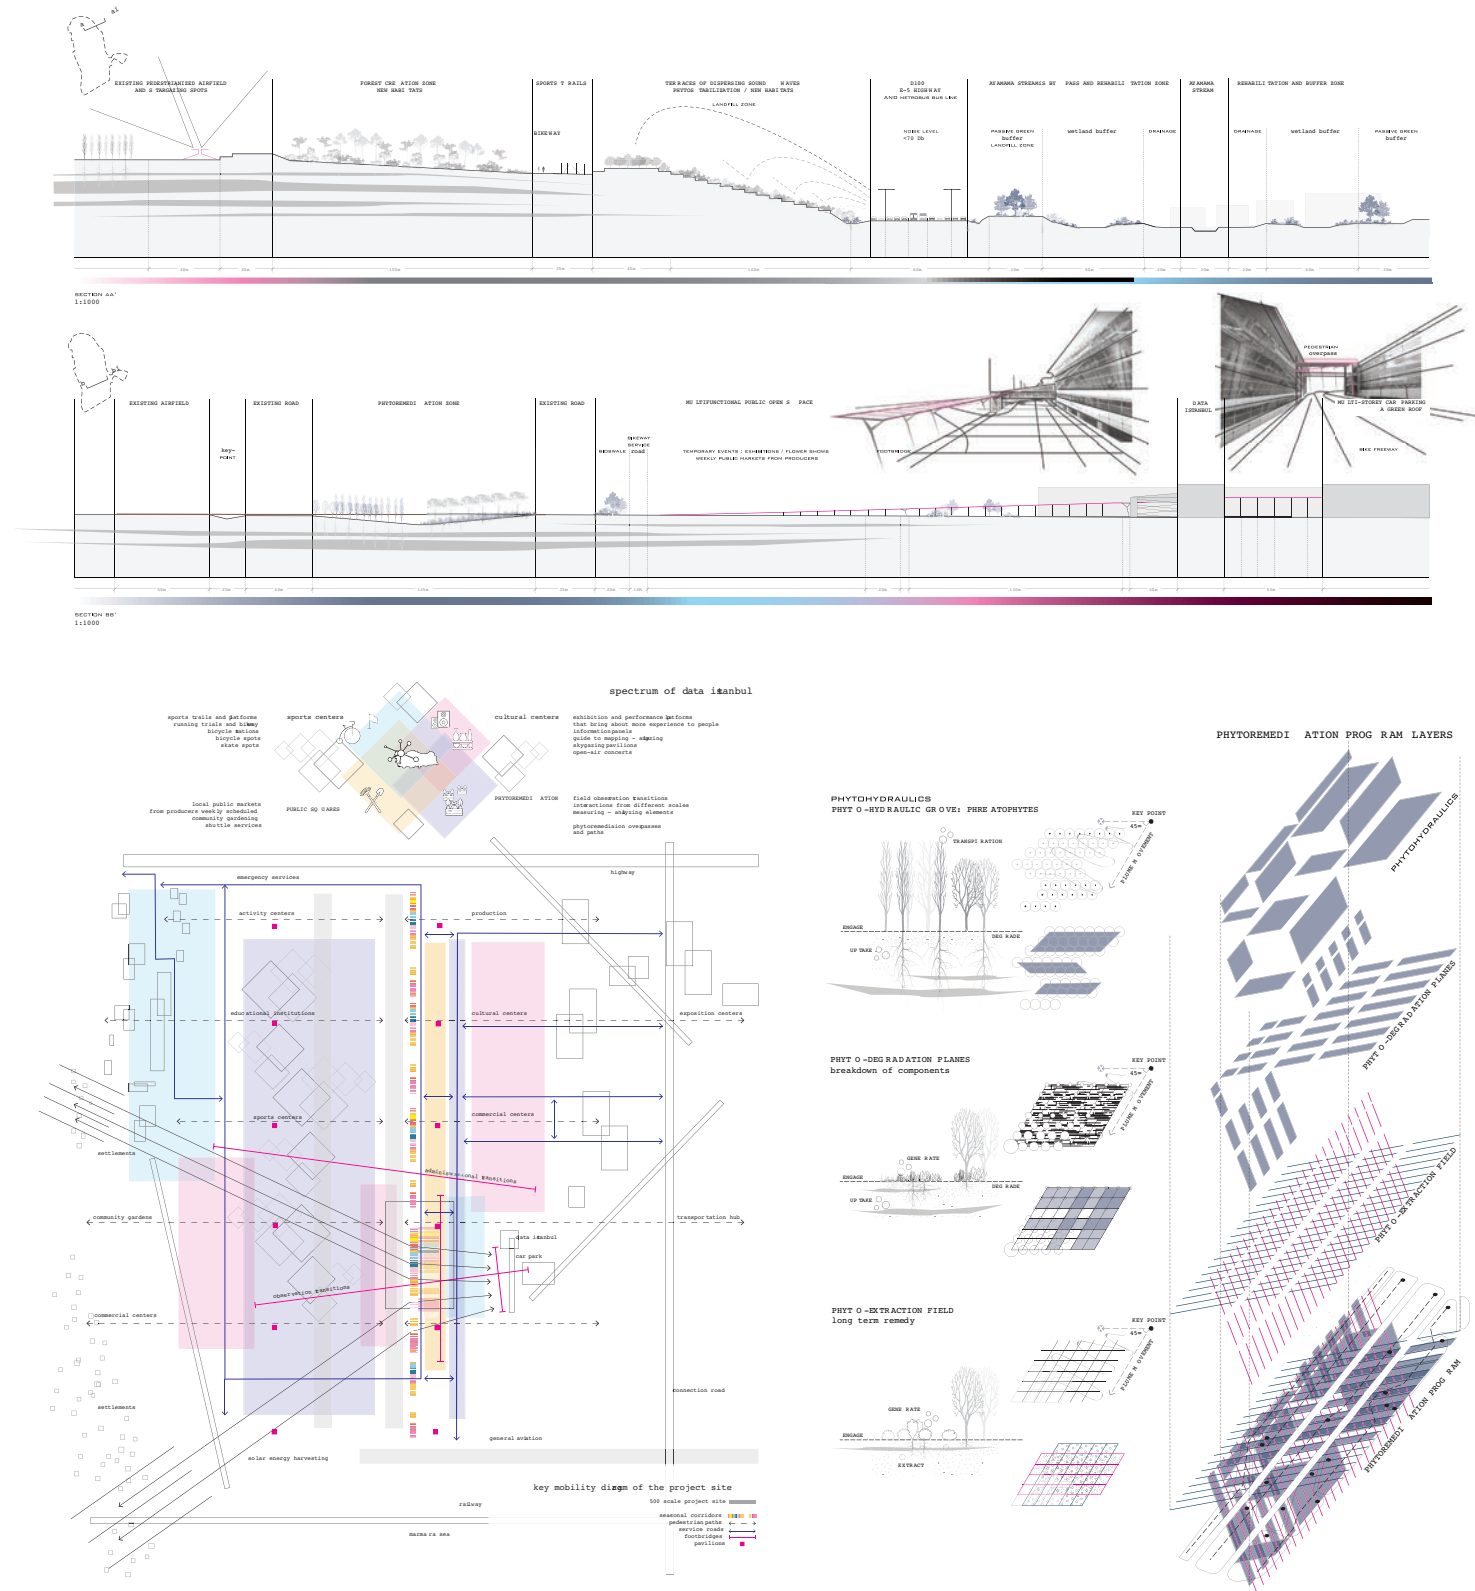

491

KEY PROGRAM OF THE PROJECT SITE
CENTERS OF SCIENCE AND ART FOR PRODUCTION & CREATIVITY

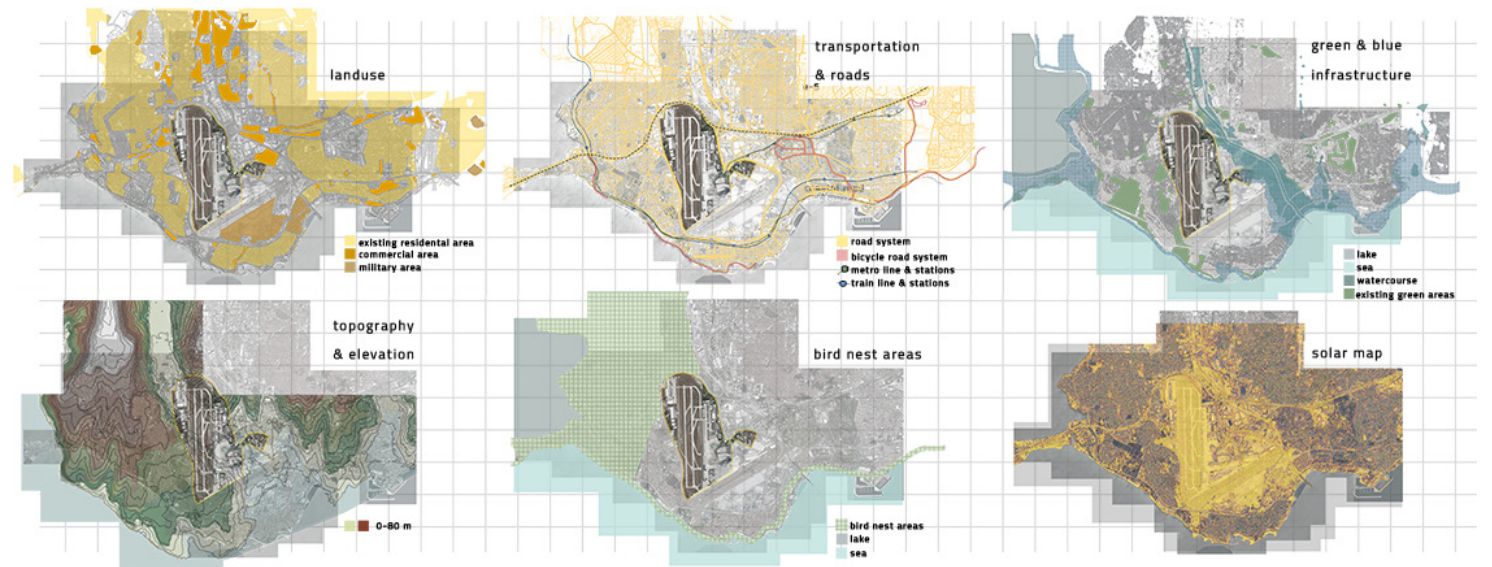

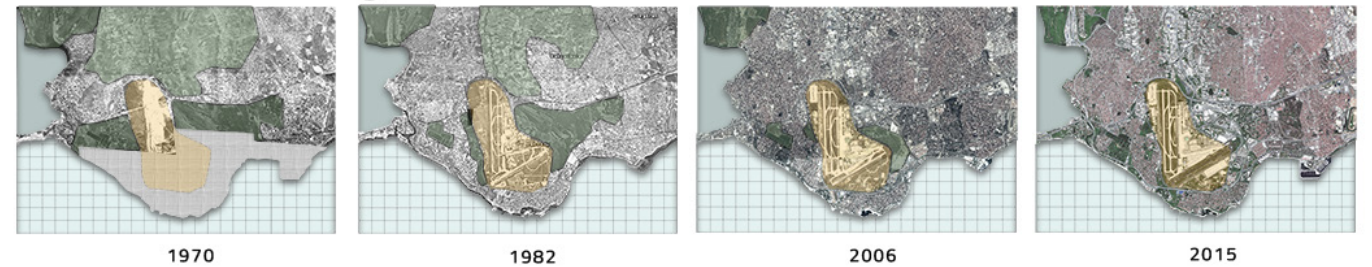

'sakkara'

Edanur Utkan

"sakkara" was produced within the scope of Graduation Project carried out by Prof. Dr. Meltem Erdem Kaya, Prof. Dr. F. Ayçim Türer Başkaya, Assist.Prof. Dr. Muhammed Ali Örnek, Assoc. Prof. Dr. Deniz Aslan, and Lecturer. Dr. Gökçer Okumuş and assisted by Res. Assist. Elif Serdar Yakut and Res. Assist. Nergis Aşar under the title "Pollinate" in the spring semester of 2019-2020.

The main design decisions in the project were driven by the 'wind' factor, which is intricately linked to both the pollination concept and the airport design. To enhance pollination and movement within the area, various birds and pollinating animals were incorporated into the design. Additionally, the growing bird population in the region will continue to mimic flight patterns, referencing the planes, thereby

preserving the memory of the area's historical connection to aviation. Every year, hundreds of birds migrate through Turkey, making it a key habitat for short rest periods during migration. In response, an ecological, sociocultural, and economic design idea was developed on an urban scale, proposing a holistic cycling route that passes through bird watching points across Istanbul, integrating the area into

this larger system. In addition, the project aims to serve ecotourism by creating an open, accessible space for people of all ages and backgrounds. Furthermore, the goal is to foster ecological diversity by enhancing pollination, supported by the activity of animals such as birds, bees, wasps, and butterflies.

Atatürk Airport, located in the Bakırköy district, plays a critical role in bringing a new urban park to Istanbul due to its significant land area, location, and scale. Therefore, the design decisions for the project were shaped by comprehensive analyses conducted on the scale of Istanbul. Embracing the principles of landscape urbanism, the design aims to create a holistic space that contributes ecologically, socioculturally, and economically to the city, while preserving dynamic, functional, and national memory.

The site is divided into three distinct zones: core, buffer, and transition. The Core zone focuses on pollination and bird habitats, featuring a wide variety of plants that remain active throughout the year, wetlands formed using the existing canal infrastructure, shelters for birds, open spaces for people, and fruit trees. The Buffer zone encircles the Core and includes a grove system. Four entrances provide access to the park, with circulation routes designed for vehicles, bicycles, and pedestrians, organized into primary,

secondary, and tertiary road systems. Additionally, the design incorporates several functional and recreational features, including edible gardens, orchards, a farmer's market, greenhouses, activity hills for interactive installations, open-air exhibition spaces, performance areas, viewing terraces, recreational zones, seating areas, entrances, meeting spaces, sport facilities, event meadows, theme gardens, and energy production zones.

birds & plane crashes

"An airport alone has a regional impact on bird populations. It is frightening that storks that have to descend on the roofs of the houses cannot find any mixed land to be put in Istanbul, and have to migrate hundreds of kilometers of hungry without food. Otherwise, plane collisions will harm a few individuals, so be sure that many birds are killed by the collisions on the highways. Birds cannot escape from vehicles traveling faster than 80 kilometers, however, hunger and constant fatigue collapse the whole population."

ornithologist Assoc. Dr. Zeynel Arslangundođdu

Compared to Yeşilköy, at least 4 times more birds pass through the region where the 3rd Airport will be built and the risk of accidents is much higher. According to the risk modeling of Arslangundođdu based on data such as the size of the airport, the number of flights and the amount of birds to pass through the airspace, there is a probability that there will be at least 2-3 accidents caused by birds every year.

user profiles

a public urban park for:

users of pollination

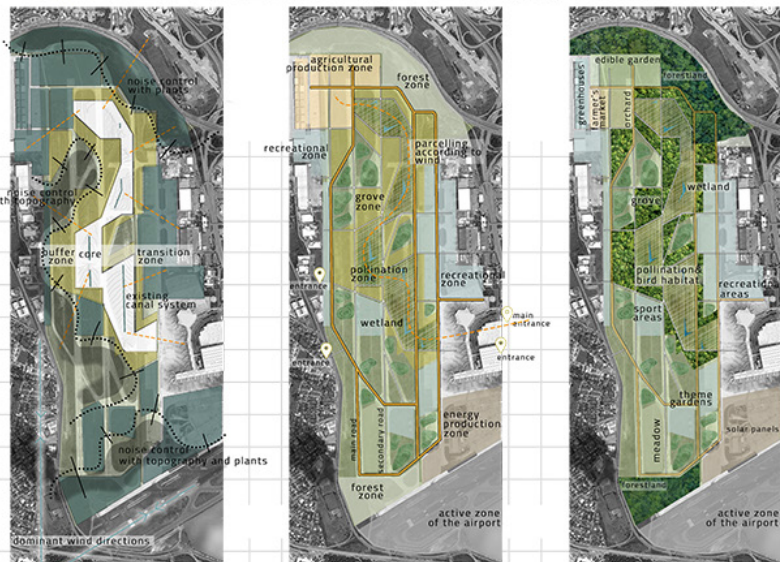

process

The transformation of existing contaminated hard floors into a green texture in the project area has been designed with the succession method at certain time intervals according to this:

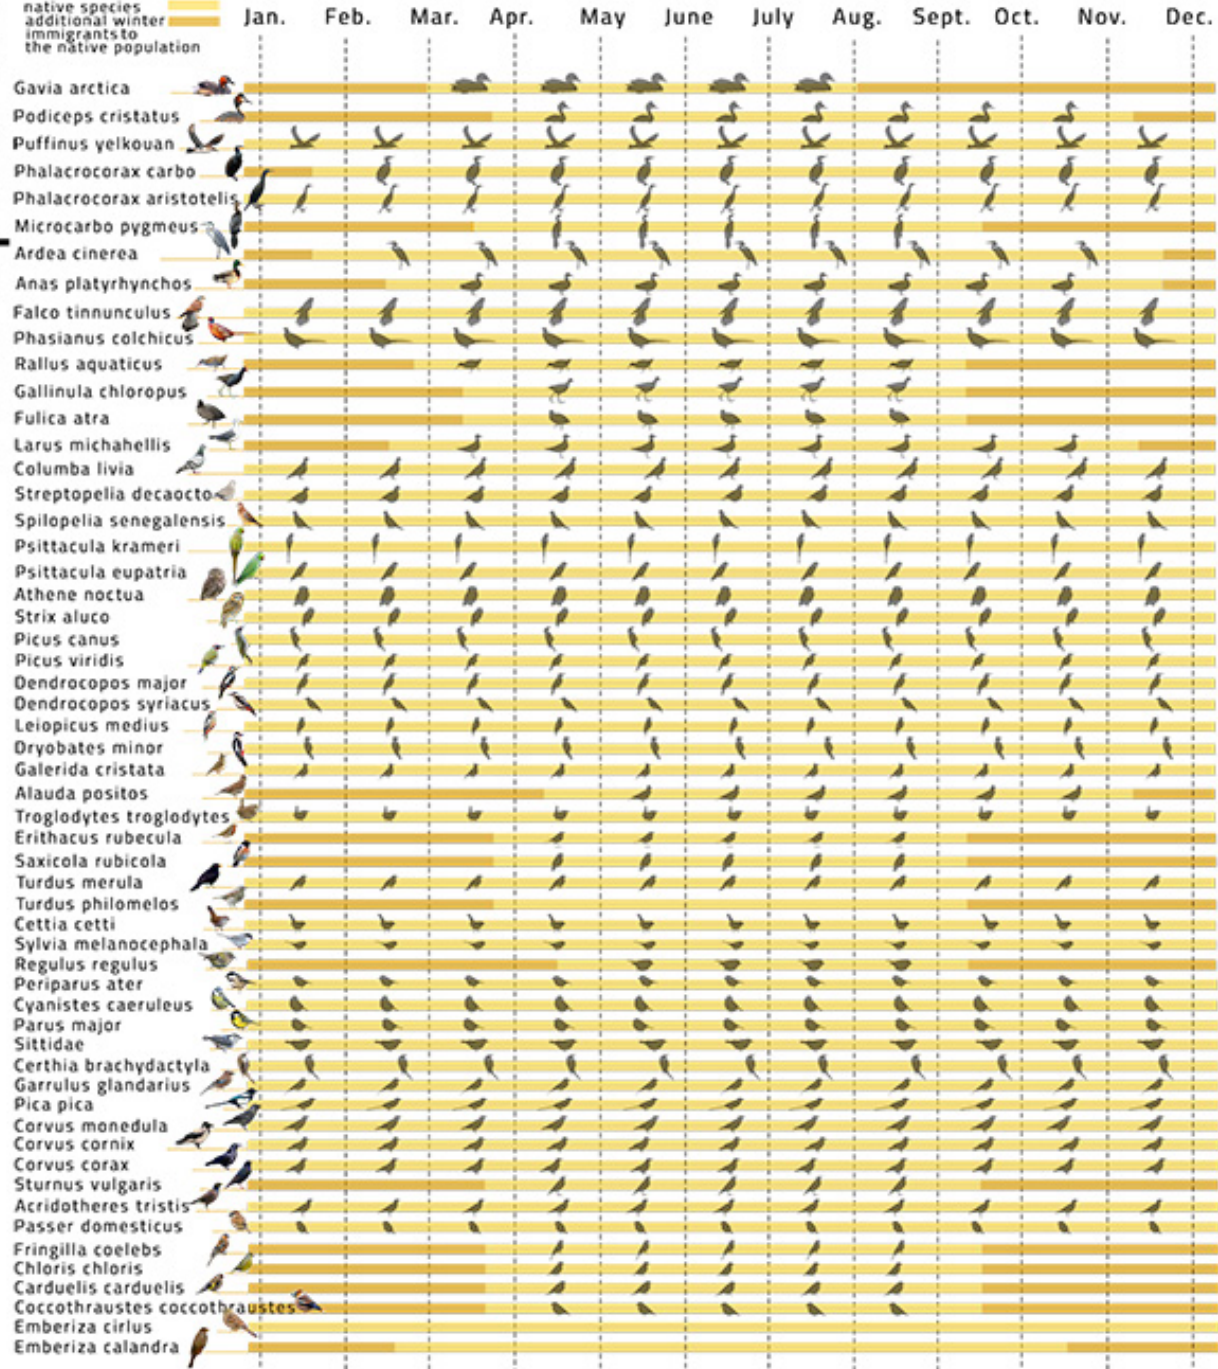

1-5 years: formation of new zones by transporting herbaceous plants and seeds through pollinators

5-10 years: involving shrubs and young trees

10-50 years: the formation of mature individuals, reaching the final form of groves, forests, wetlands and also bird habitat & pollination area

bird species

Taksim Encounters

Mehmet Bulut

“Taksim Encounters” was produced within the scope of Graduation Project carried out by Prof. Dr. Hayriye Eşbah Tunçay, Prof. Dr. Gülşen Aytaç, Assist.Prof. Dr. Melih Bozkurt, Assoc. Prof. Dr. Olgu Çalışkan, M.Sc. Arzu Kutkam, M.Sc. Zuhal Kol, and Carlos Zarco Sanz, and assisted by Res. Assist. Nergis Aşar and Res. Assist. Gizem Aluçlu under the title “Landscape Democracy: Taksim” in the fall semester of 2020-2021.

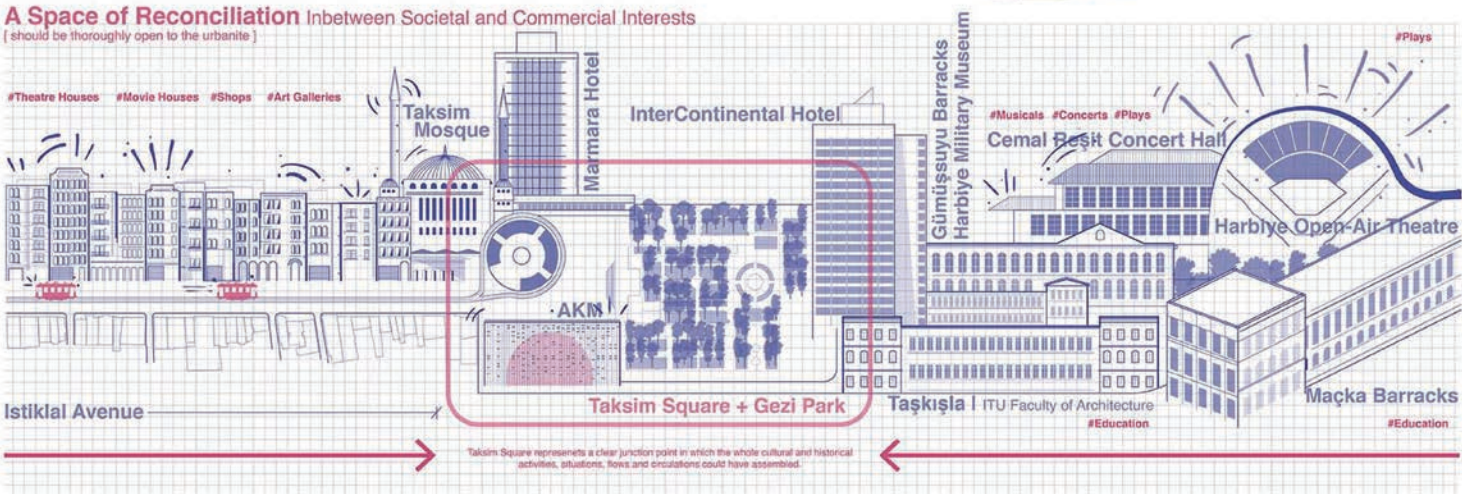

Taksim Encounters, guided by a process-based design philosophy, challenges the conventional boundaries of landscape design by exploring a new approach to open publicity in an urban environment like Taksim. The project aims to integrate both intangible and tangible design interventions, seeking to blend digital and physical elements within urban space to foster a more cohesive and public use of the area. This integration creates an

engaging, democratic framework that strengthens the historical and socio-cultural context of Taksim Square, Gezi Park, and the surrounding area as a whole.

Moreover, the overlapping layers of this landscape design approach connect the ecological, physical, and contextual components of the space. By incorporating interrelated urban elements such as Cumhuriyet Street, Gezi Park, Taksim

Municipal Garden, Republic Square, Maksem, the Underground Level, and the Atatürk Cultural Center, the project treats these areas as integral parts of the entire urban environment. These elements are unified under the concept of urban democracy, coupled with an open-use design approach—Loci—to broaden the conceptual scope of the urban design and landscape system.

democracy as a social device for an engaging urban life

"Democracy is based on the freely-expressed will of the people to determine their own political, economic, social and cultural systems and their full participation in all aspects of their lives." The Vienna Declaration on Human Rights states: "As the concept of democracy addresses, the right of equal self-determination of peoples, and respect for individual collective human rights and fundamental freedoms are the essential bases when it comes to the urban rights and public consensus. And, in this sense, democracy is the best safeguard of freedom of expression, tolerance of all groups of society, and equality of opportunity for each person."

With respect to this, democratic urban approaches should be integrated to the public life where every individual has its own narrative, and, as the concept of democracy implies, where every individual voice matters. Here, democracy stands forward as a social device for public consultation in the scope of urban design. Taking democracy as a design input, people should have a position in the city where the acts, events, interactions, experiences are paved by the people, for the people. And further, every individual also should have the right to claim her/his discourse in every-locale of urban environment.

Regarding these urban approaches, in this particular design case, Taksim has been taken into consideration as one of the five important parts of a bigger whole which is treated with an intense social, cultural and historical values. And the people of this region represent a great intense diversity comprising of students, academics, artists, musicians, directors, performers, art lovers, craftsmen, traders; and every and each one of the has a unique discourse and demand to public life. And accordingly, the urban fabric is also treated through this diversity: art galleries, movie houses, theater houses, studios, ateliers, museums, concert halls, historical places etc.

For this diversity to come to life, an incentive urban design system is proposed where the people arrange their unique acts along the region. With a number of "lois" and a following route, people are considered to organize their events, gatherings, meetings, social activities etc. All are unique from each other, temporarily aroused and can be easily removed or changed by the people, lois are integrated to represent the public solidarity for the people. And the main course, here, is to strengthen the role of people in city; to bring them in such a position where they all have the right to demand, right to be heard, right to be exist in a democratic and collective urban ground.

Potentials + Situations + Problems + Critics on Today's Gezi Park & Taksim Square

1 Gezi Park + Taksim Municipal Garden

Gezi Park has been one of the most valuable assets in the present urban state of both Istanbul and Taksim. It was the first park of the Turkish Republic history, conceived by Hani Pasa in 1940 to serve as a public space. Yet, despite its essential urban value and location, Gezi Park has not been used and functioned well for people based on several reasons:

The monumentalized state of Gezi Park

With its strong political memory, Gezi Park has been treated as if it is a giant urban monument. For a long time, Gezi Park has been perceived as an urban ornament to watch or to pass by; not to engage in or to perform any kind of daily activity, which is the most essential feature that an urban park should have. This situation doubtlessly makes the Gezi Park, as a solidified "urban object", rather than a vibrant public space.

All this stems from the political weight that has accumulated on the Gezi Park and all Taksim region in time. Exaggerated political identity of Taksim, as a particular point of view, has solidified the urban opportunities which today, ended up with monumentalized public spaces.

Also, this political heaviness of Taksim makes the urban life much more enclosed for people in an intangible manner. People, actually, cannot feel they can interact with the space, get engaged with its abundant public life, encounter in a wide range of opportunities. And ultimately, in the scope of urban democracy, people had been excluded from the urban life.

A kind of an urban park: Gezi Park

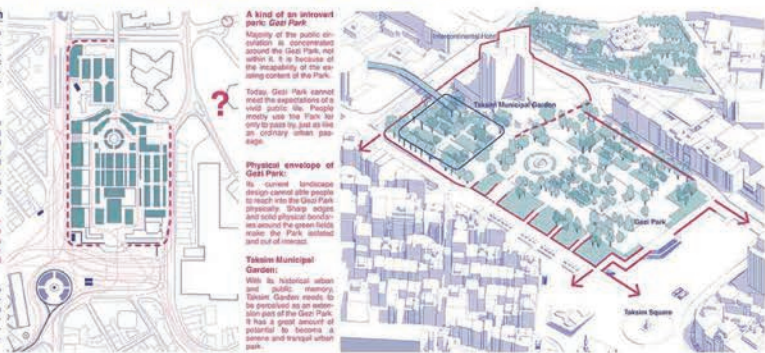

History and urban fabric situation is compressed within it. It is because of the meaning of the name of the park, which is a kind of an urban park.

Physical envelope of Gezi Park

Its current landscape design cannot allow people to reach into the Gezi Park directly. They are not able to see the park as a whole, and the park is not able to be a part of the urban fabric.

Taksim Municipal Garden

With its historical urban and public memory, Taksim Garden needs to be a part of the Gezi Park. It is a potential to become a vibrant and integral urban park.

2 Taksim Square + Underground Encounters

Taksim Square, as a part of landscape system, Taksim Square, as an urban place, should be examined as a public ground attached to the Gezi Park. The relationship between the square and the Gezi Park is one of the most essential potentials of the Taksim Square, of which the main reason is the identity of Square in today is the disconnect to the Gezi Park. In other words, Taksim Square should be seen as a part of the holistic understanding of the landscape system.

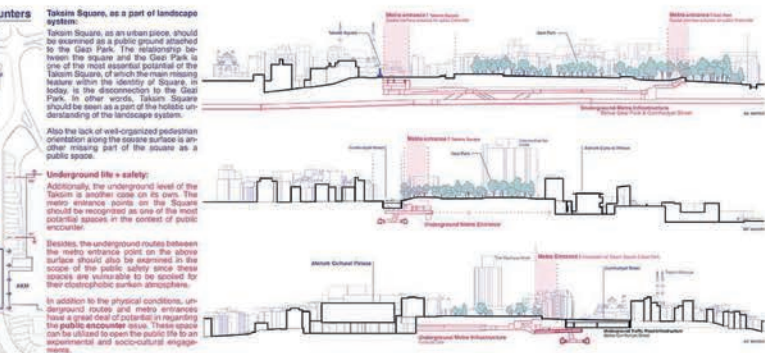

Also the lack of well-organized pedestrian orientation along the square surface is another missing part of the square as a public space.

Underground life + safety

Additionally, the underground level of the Taksim is another case on its own. The main entrance points on the Square should be recognized as one of the most potential assets in the context of public encounter.

Besides, the underground routes between the metro entrance point on the above surface should also be expressed in the scope of the public safety since these spaces are vulnerable to be closed for their distinguished urban structures.

In addition to the physical conditions, underground routes and metro entrances have a great deal of potential in regarding the public encounter issue. These spaces should be opened to the public life as an experimental and socio-cultural engagement means.

3 Atatürk Cultural Palace + Atatürk Library

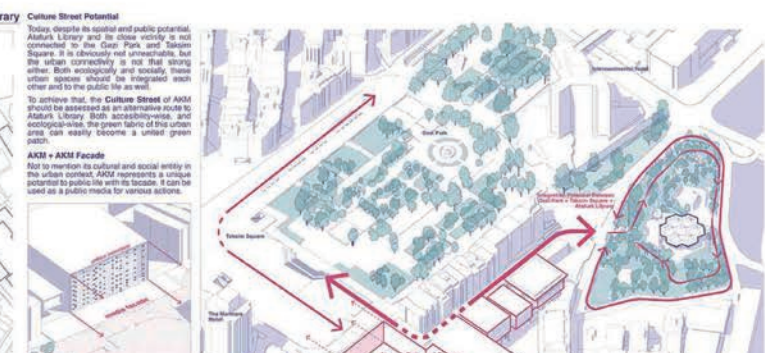

Culture Street Potential

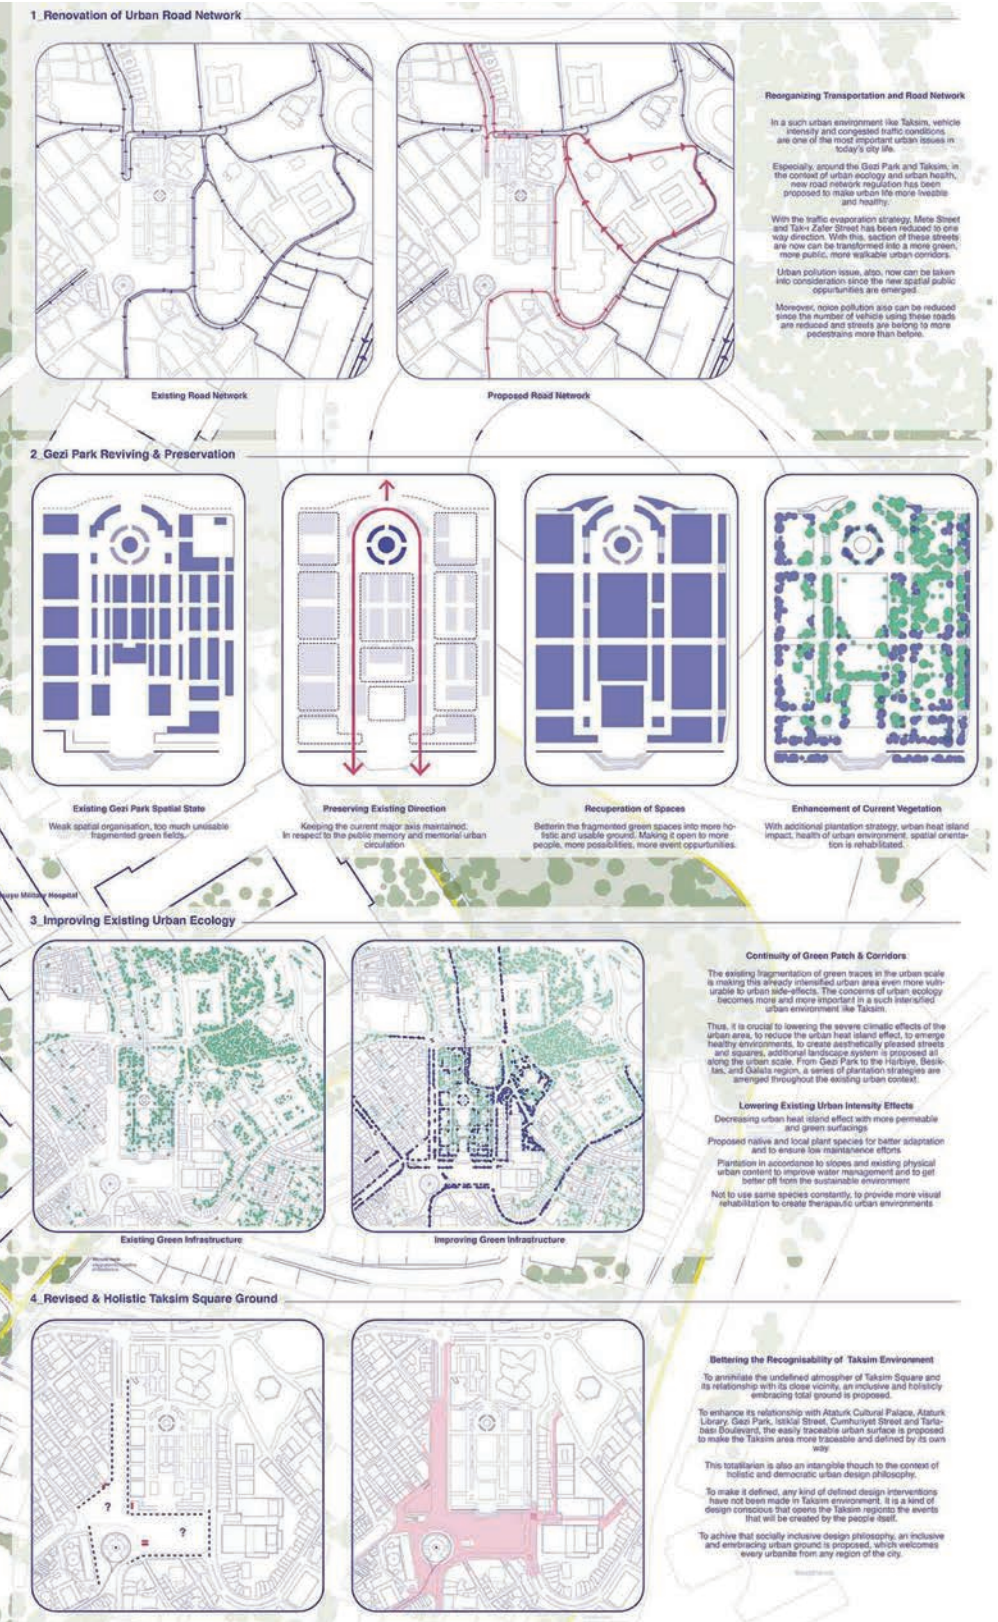

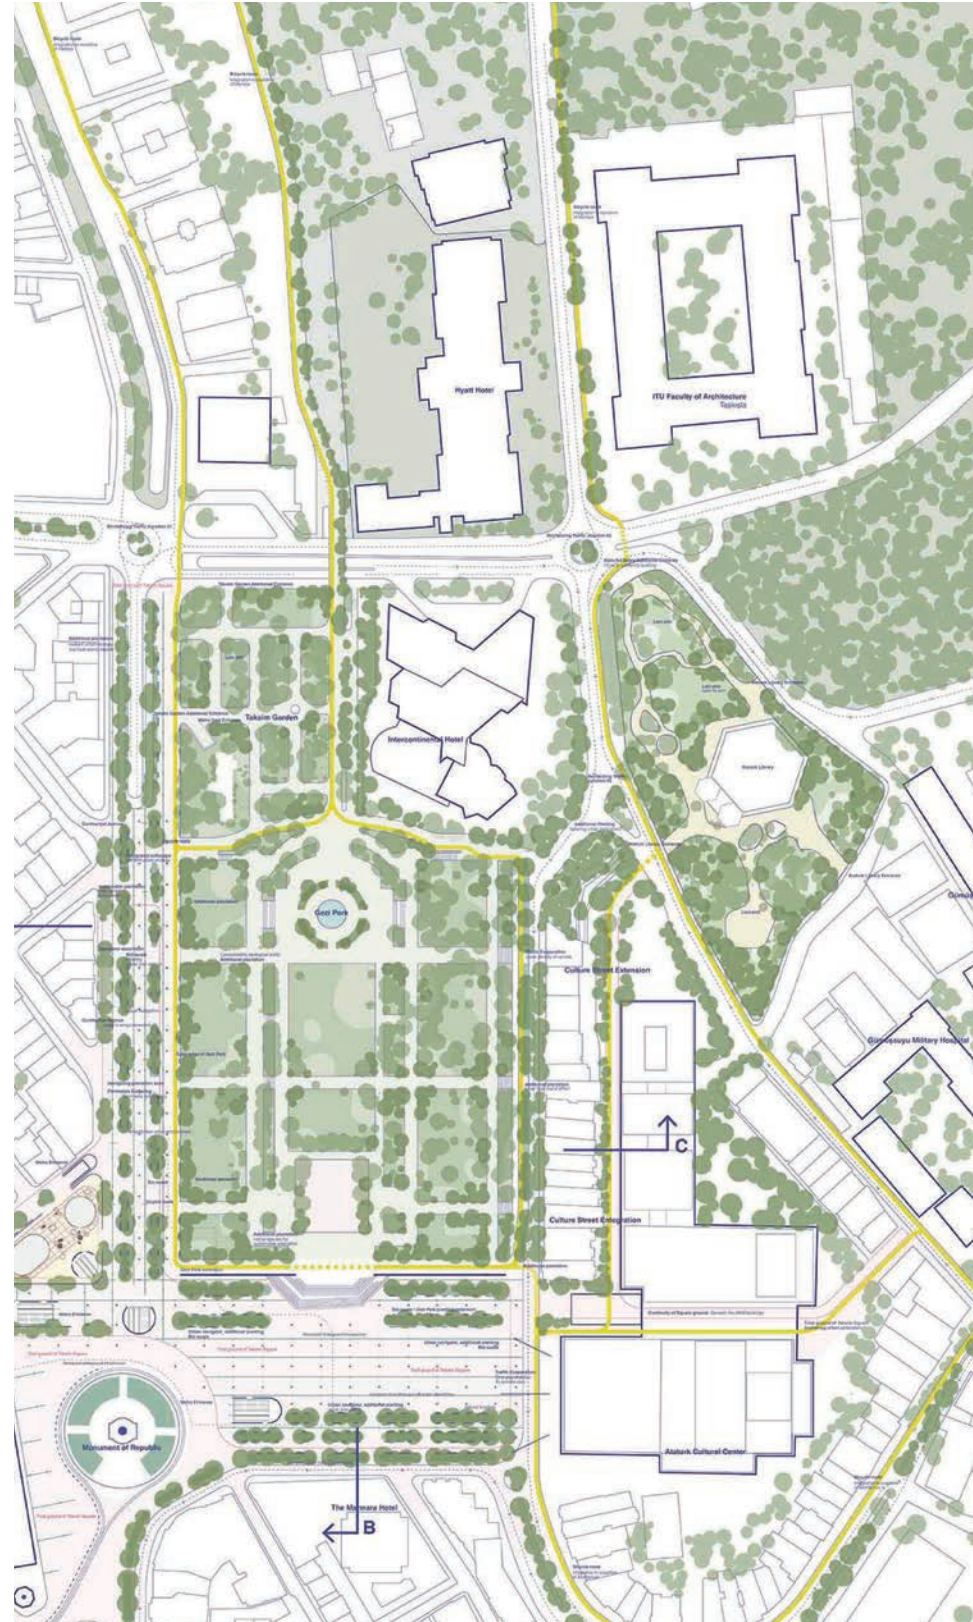

Taksim, despite its special and public potential, Atatürk Library and its close vicinity are not connected to the Gezi Park and Taksim Square. It is obviously not unreasonable, but the urban connectivity is not that strong either. Both ecologically and socially, these urban spaces should be integrated each other and to the public life as well.

To achieve that, the Culture Street of AKM should be assessed as a potential route to Atatürk Library. Both accessibility-wise, and ecologically, the green fabric of the urban area can easily become a united green space.

AKM + AKM Facade

Not to mention its cultural and social entity in the urban context, AKM represents a unique potential to public life with its facade. It can be used as a public media for various actions.

Underground Plan | 1:1000

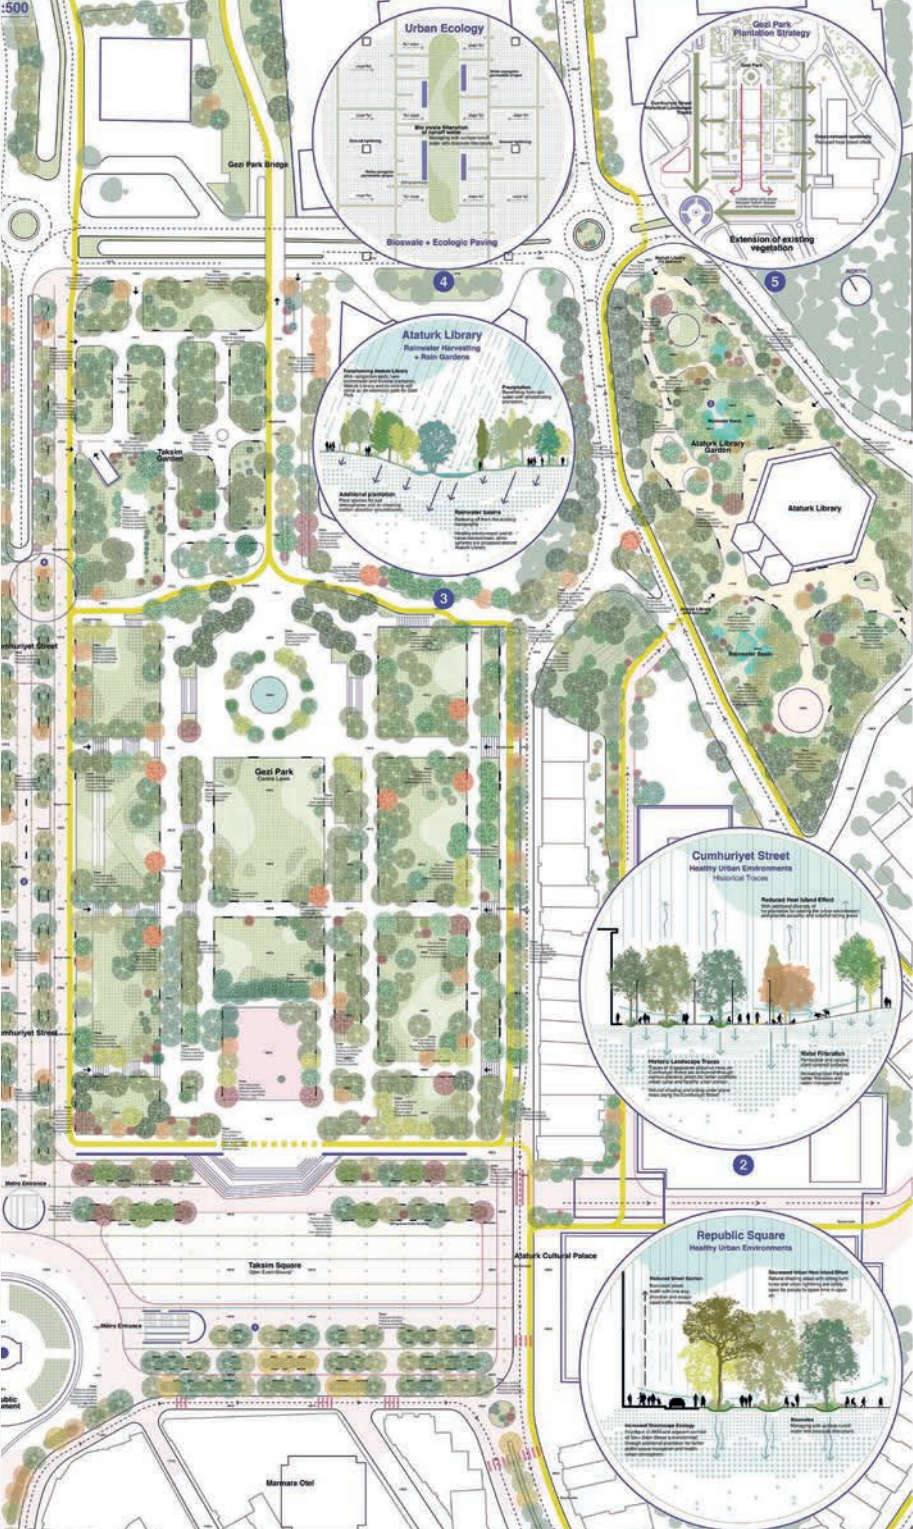

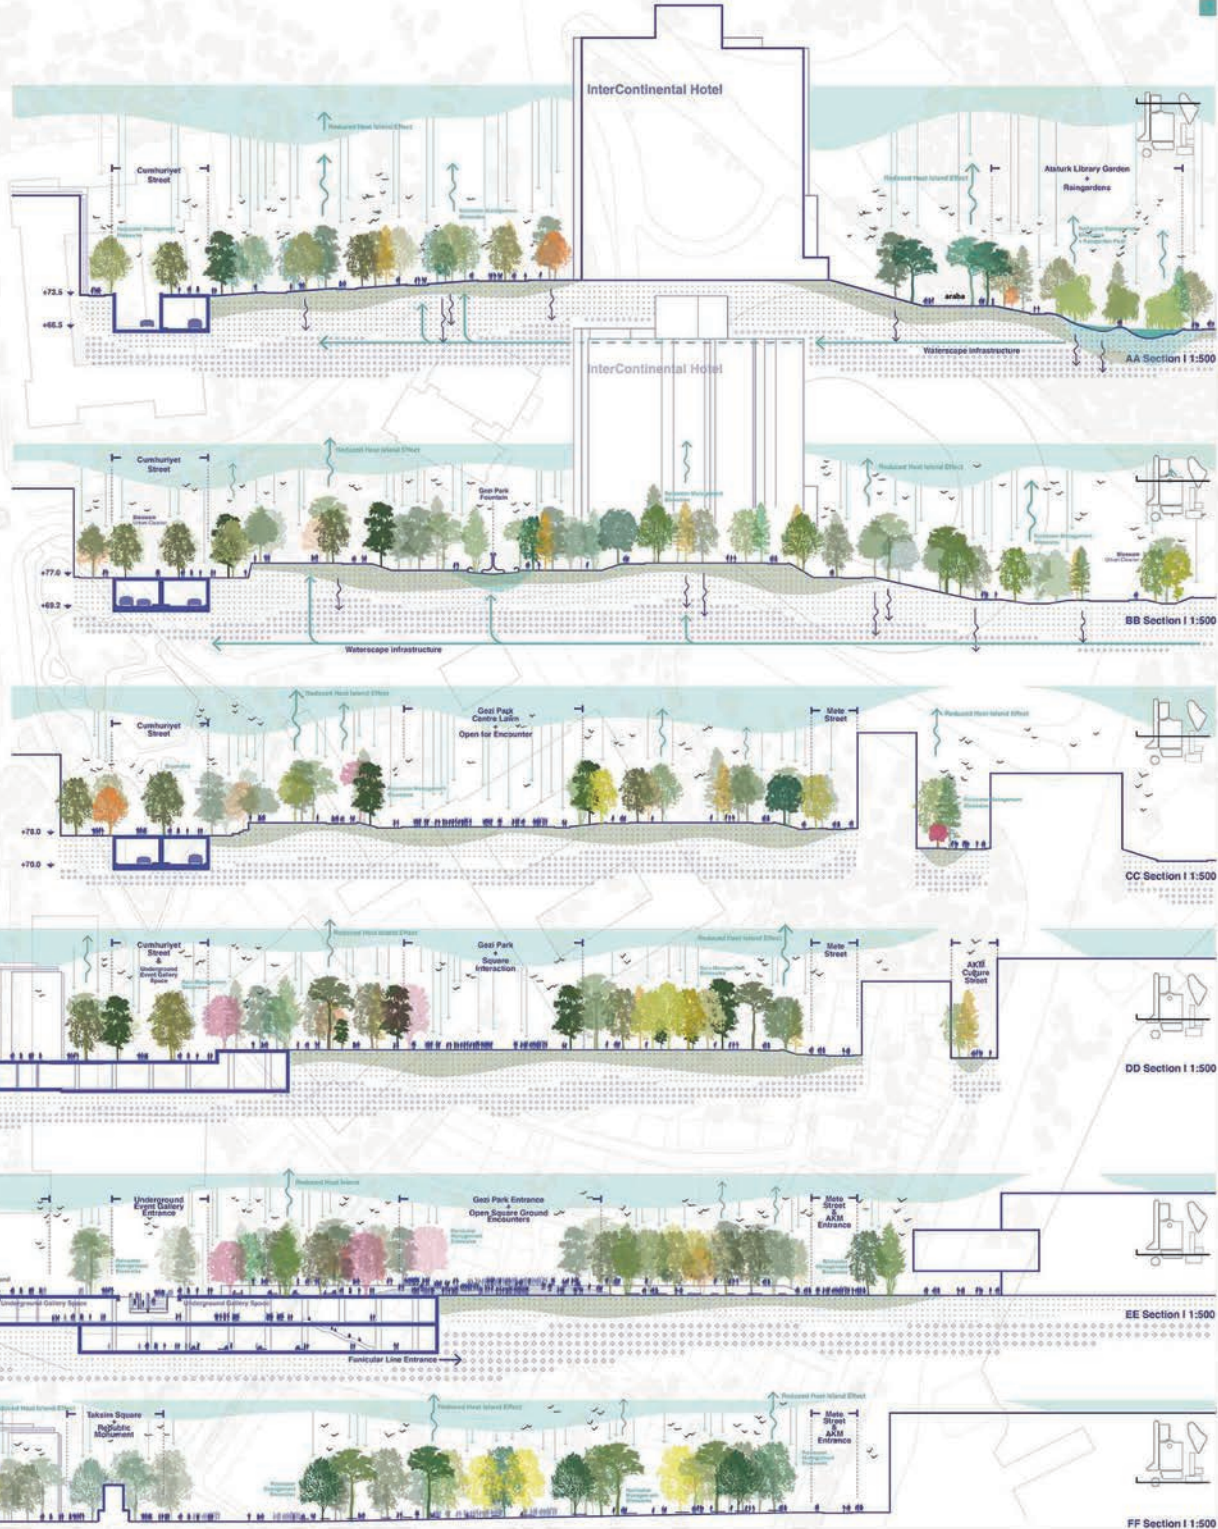

5. Revitalizing Underground Infrastructure

New regulation of underground urban layer:
Combining the superior underground sites to create better navigating and circulation along the underground atmosphere. Also to renovate the above ground surface, new infrastructures are proposed in order to emerge more defined and better steering public ground.

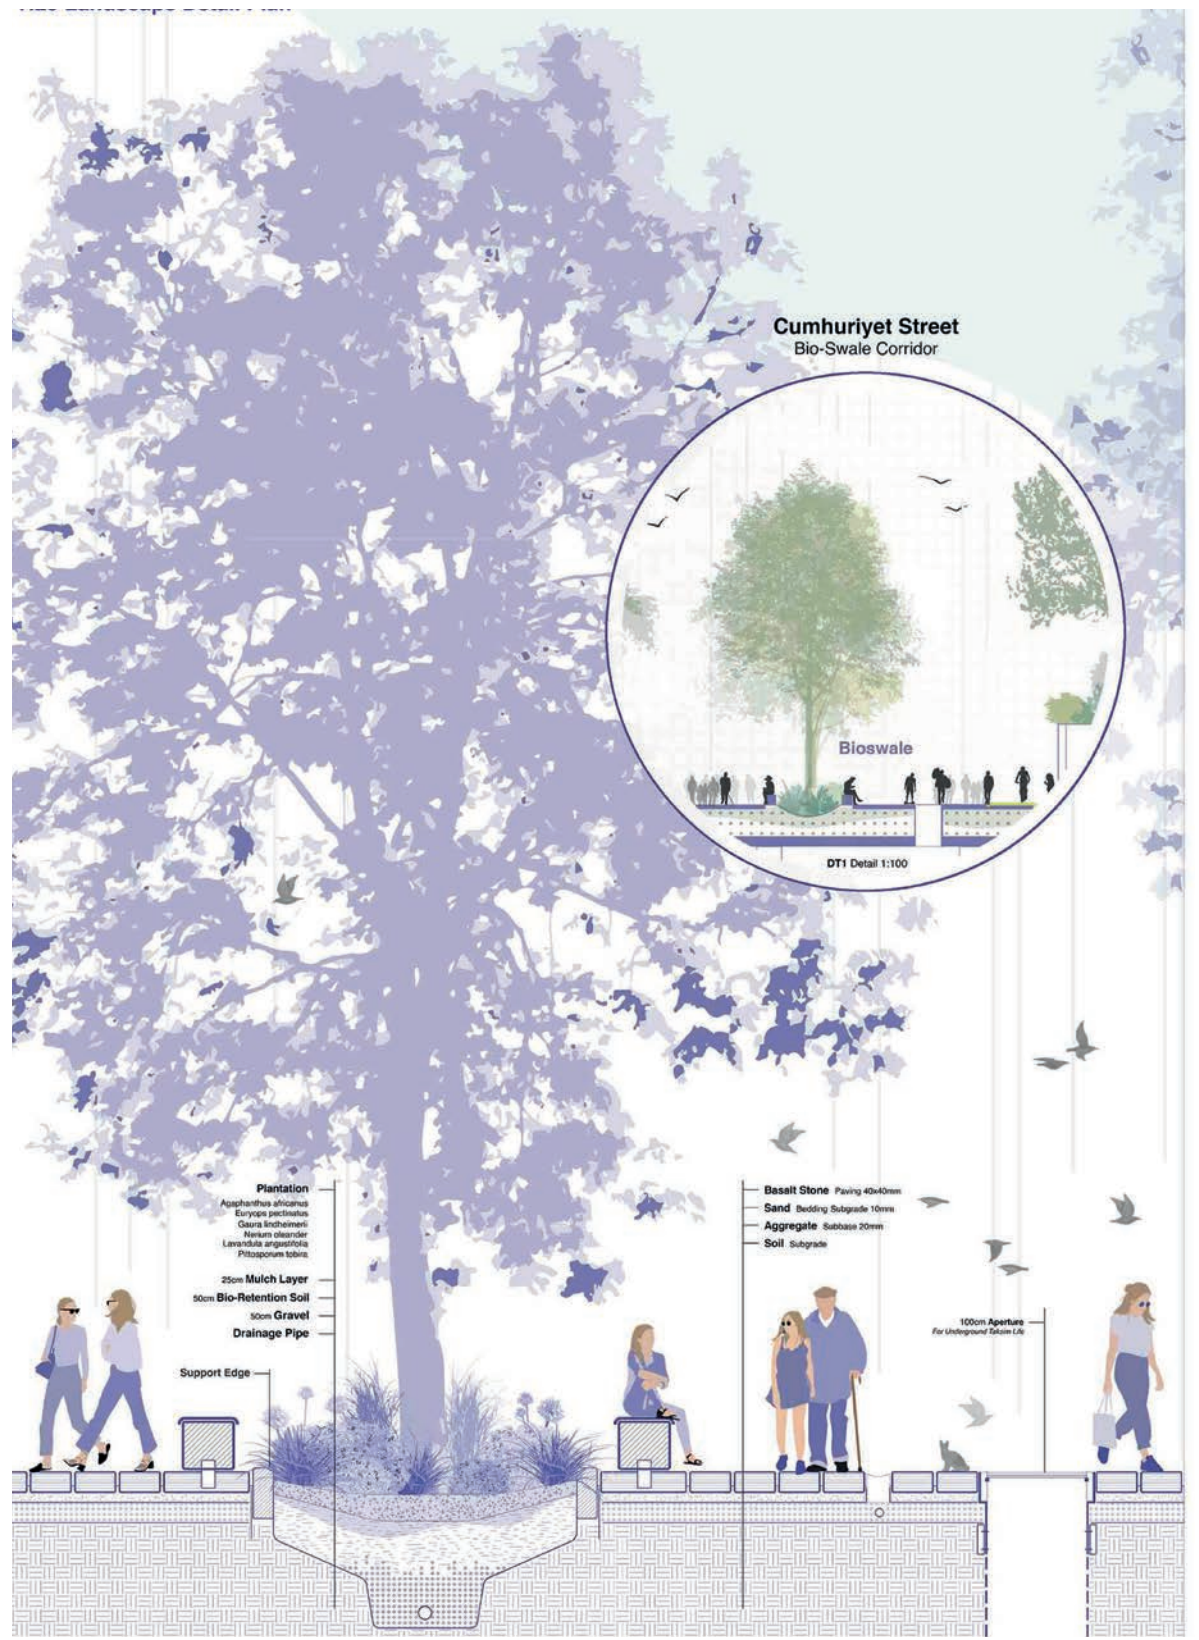

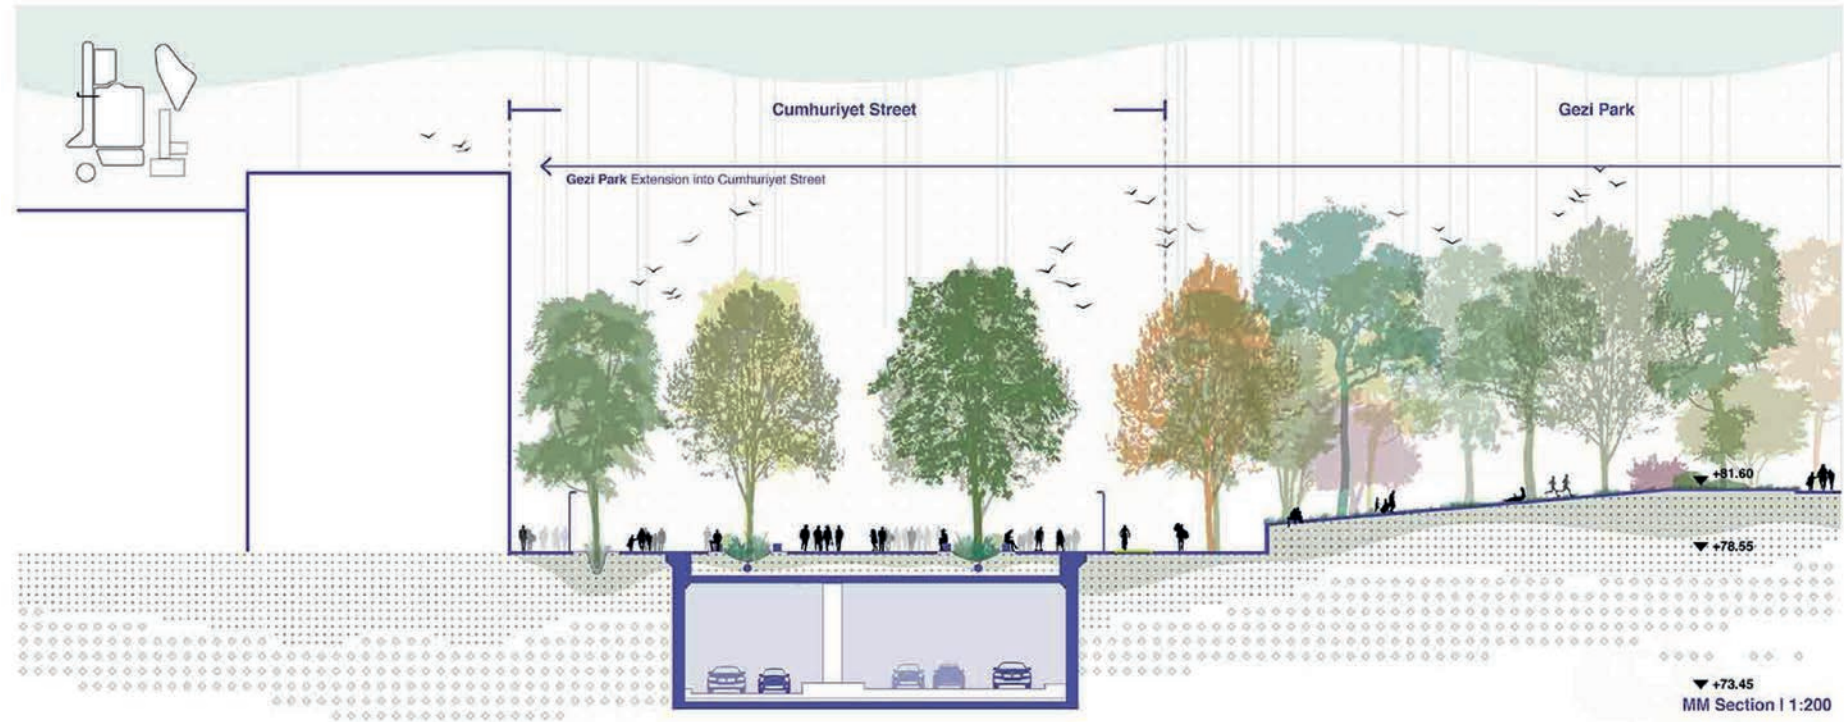

Refurbished underground life of Taksim:
The current atmospheric conditions of underground layer of Taksim are dominated with only a passage role. Which outstandingly creates a public potential for it to become a underground space where people are able to encounter with the space and with each other to share various activities, events and daily acts.

Bettering of Urban Directivity

Republic Square has also been reshaped, reanimating its historical significance, and has been re-envisioned as an "open-use public carpet" extending toward the façade of the Atatürk Cultural Center. The square has been better integrated with the underground level of Taksim through the introduction of lighter, wider, and relocated

To enhance the urban environment, traffic around the square has been reduced by narrowing Tak-ı Zafer Street and Mete Street, designating them for mass transportation only, thus promoting a cleaner and healthier urban space.

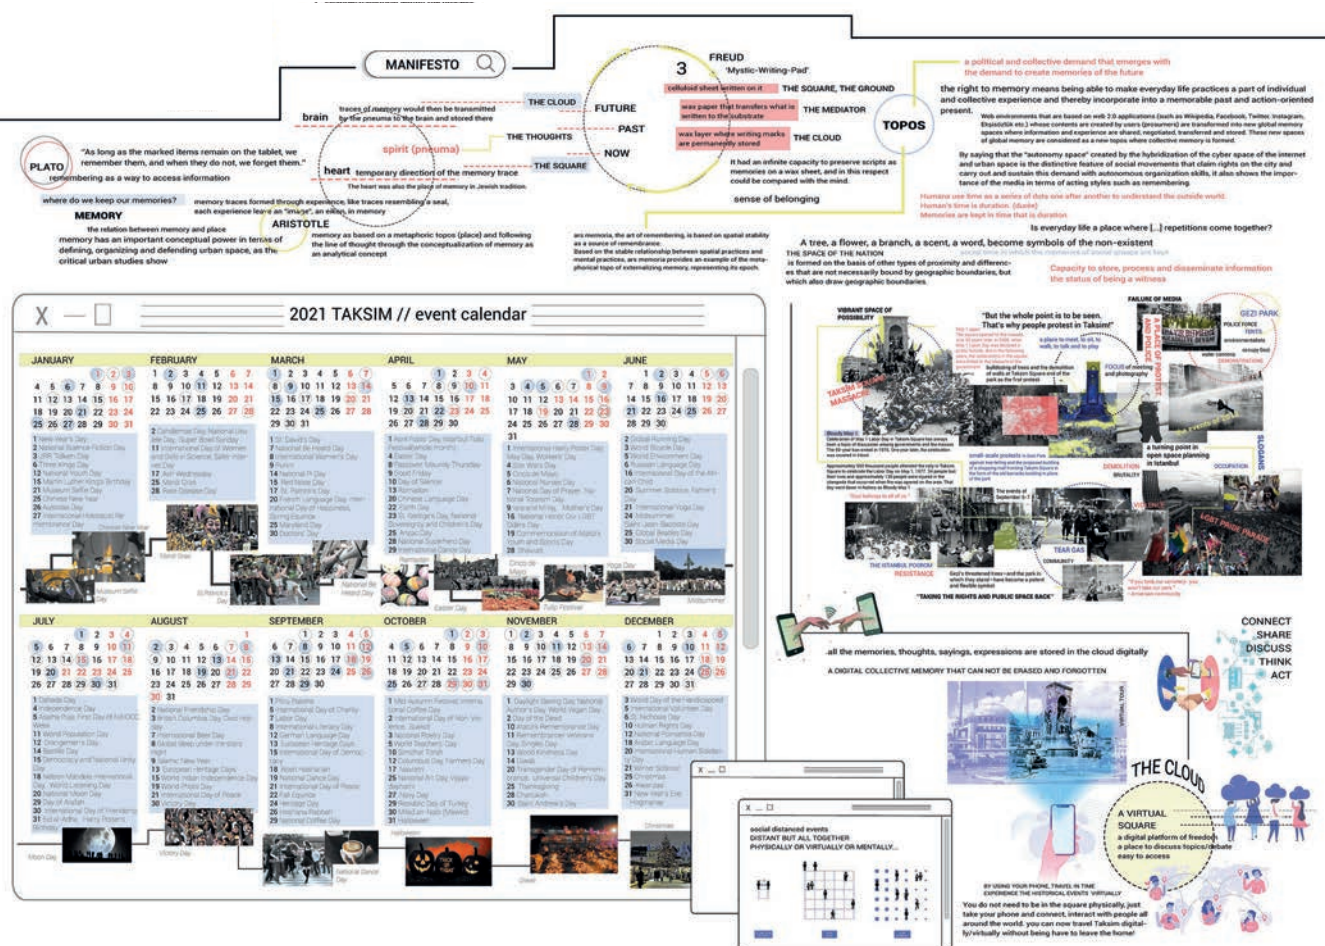

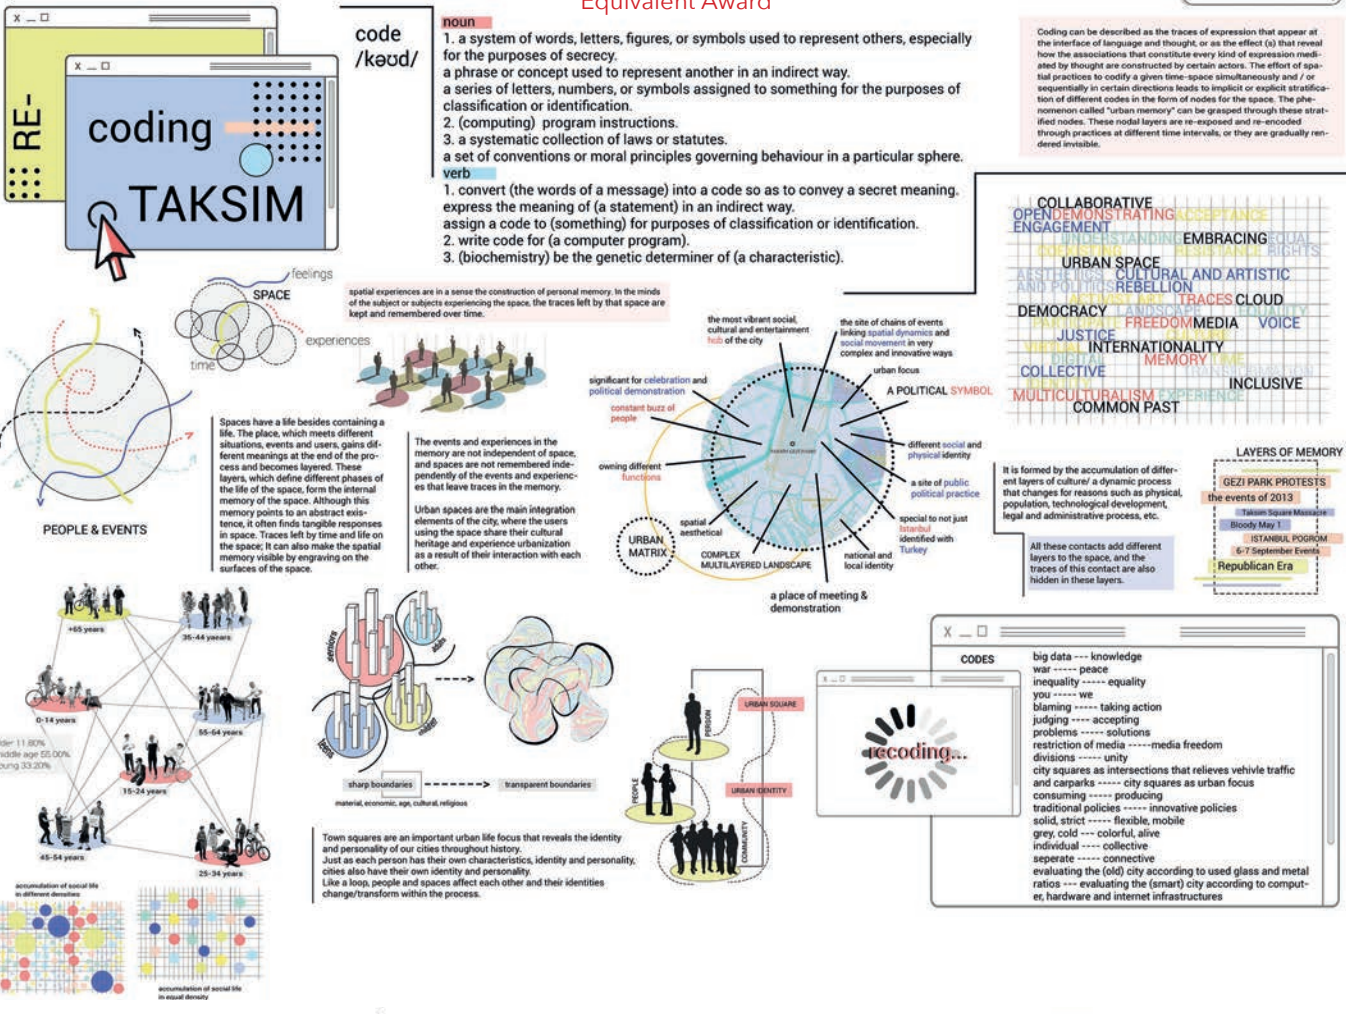

Coding Taksim

Ece Şengül

"Coding Taksim" was produced within the scope of Graduation Project carried out by Prof. Dr. Hayriye Eşbah Tunçay, Prof. Dr. Gülşen Aytaç, Assist.Prof. Dr. Melih Bozkurt, Assoc. Prof. Dr. Olgu Çalışkan, M.Sc. Arzu Kutkam, M.Sc. Zuhâl Kol, and Carlos Zarco Sanz, and assisted by Res. Assist. Nergis Aşar and Res. Assist. Gizem Aluçlu under the title "Landscape Democracy: Taksim" in the fall semester of 2020-2021.

* TMMOB Chamber of Landscape Architects • 9th Landscape Architecture Students Graduation Project Awards Equivalent Award

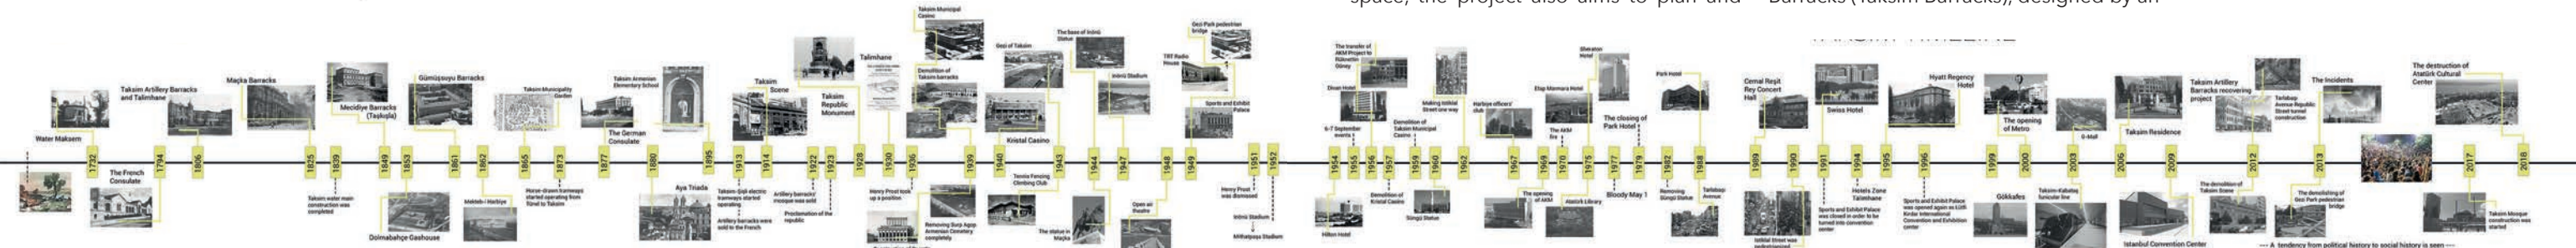

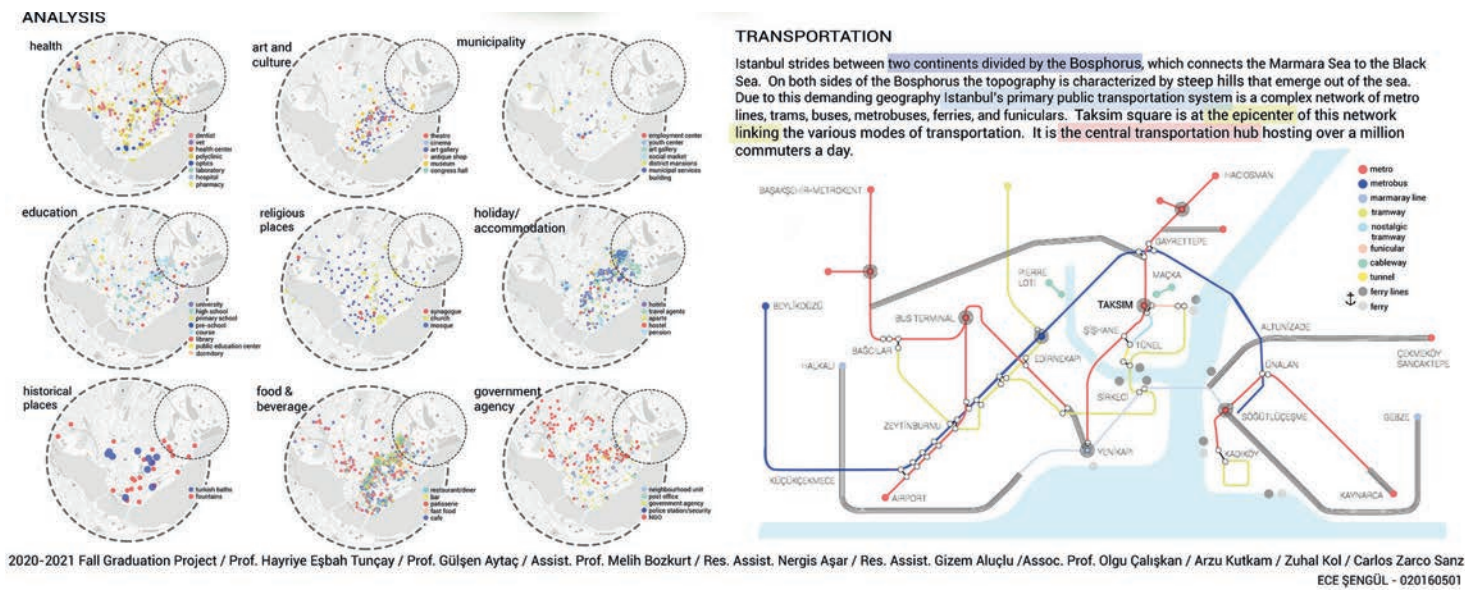

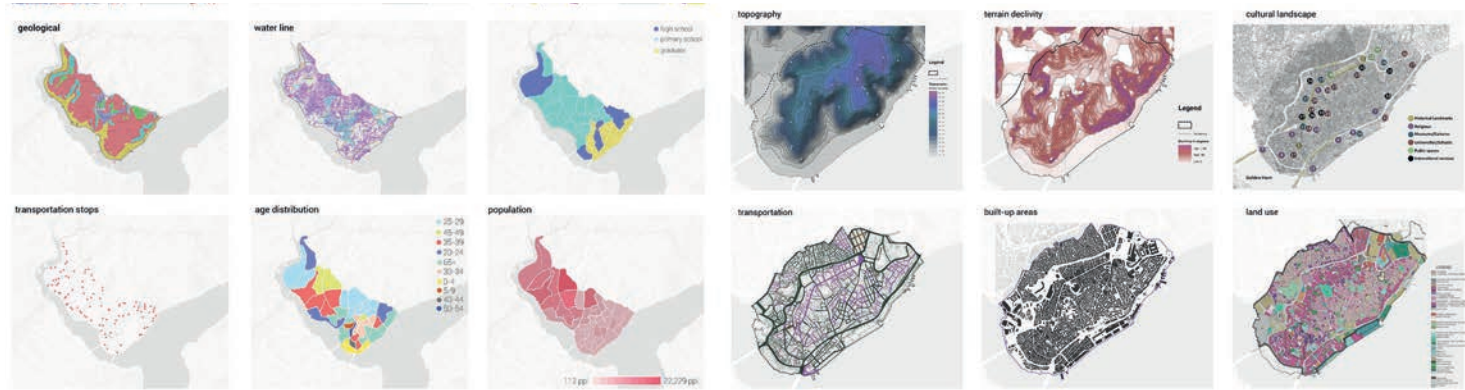

In this project, starting with the identity of the square and its surrounding areas, the historical process of change, and collective memory, new coding strategies have been developed for concepts such as disconnection, spacelessness, restriction, and inequality in order to update the region. The goal is to make the area fairer, more equal, freer, dynamic, and attractive by incorporating these new codes. Alongside planning the physical space, the project also aims to plan and

develop the square digitally. In today's digital age, where situations such as social distancing and pandemics have made everything increasingly virtual, this digital transformation is essential.

Gezi Park and Taksim Square in Beyoğlu, just outside Galata to the north of the Golden Horn, have long been venues for meetings and demonstrations. Gezi Park was once the site of the Great Artillery Barracks (Taksim Barracks), designed by an

Armenian palace architect. The large park, initially intended as a space for daily life, has come to be seen as a part of the city understood as a place for representations and demonstrations under various administrations. Over time, this location has evolved into an area marked by constant discussion and dispute. The content of these debates encompasses a wide range of issues, from social events to legal battles.

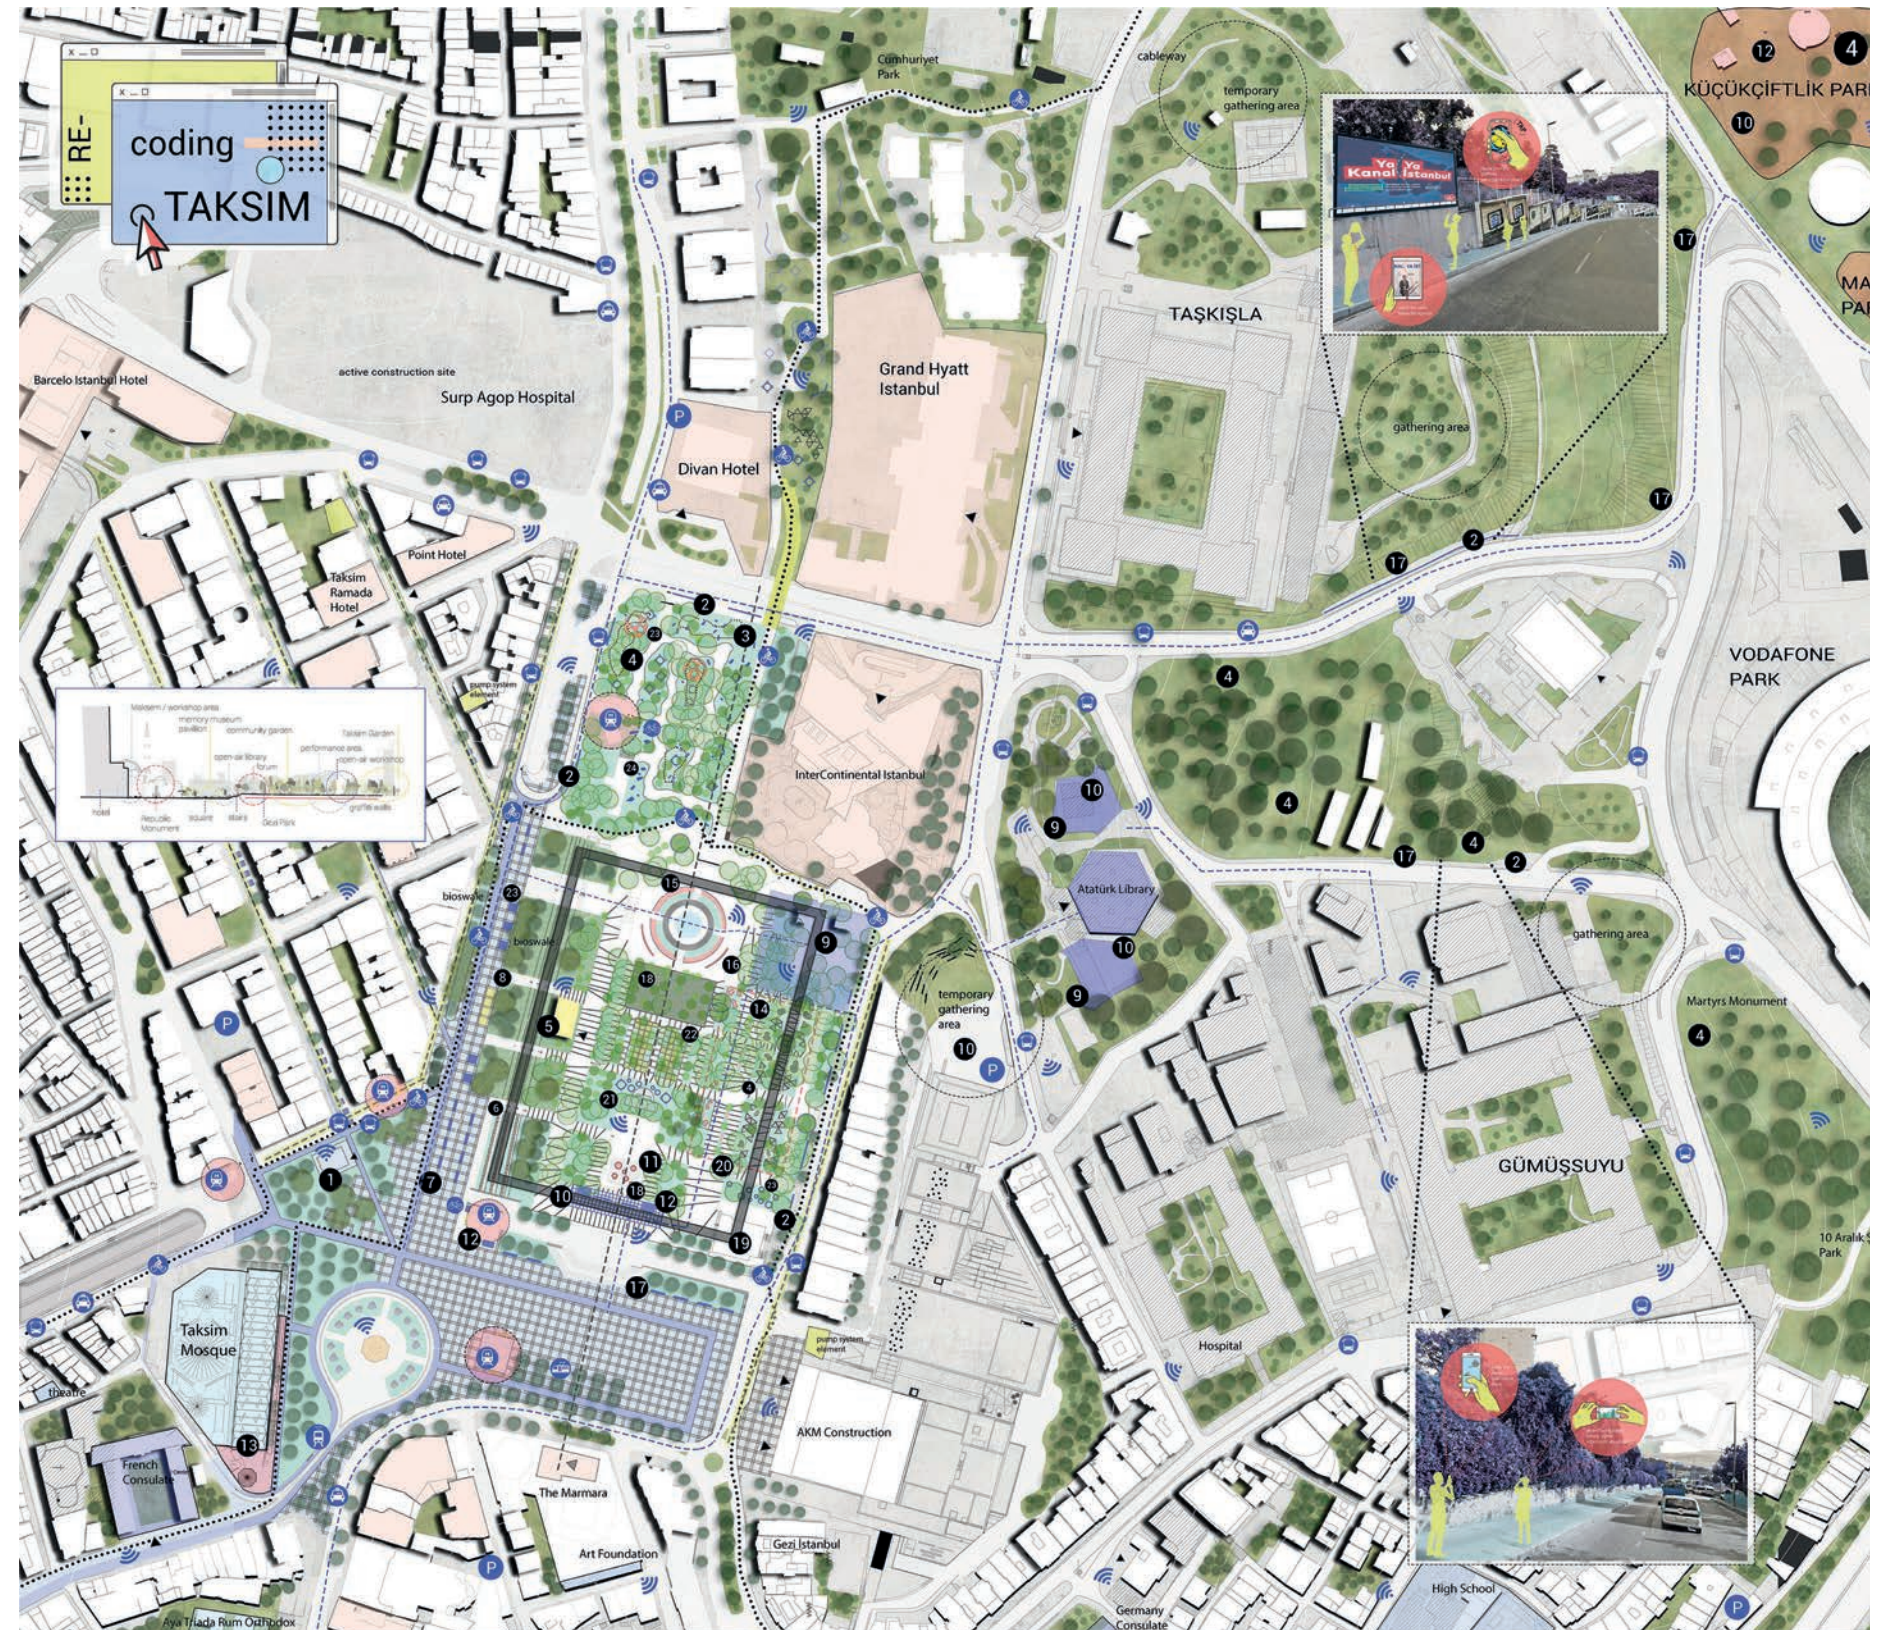

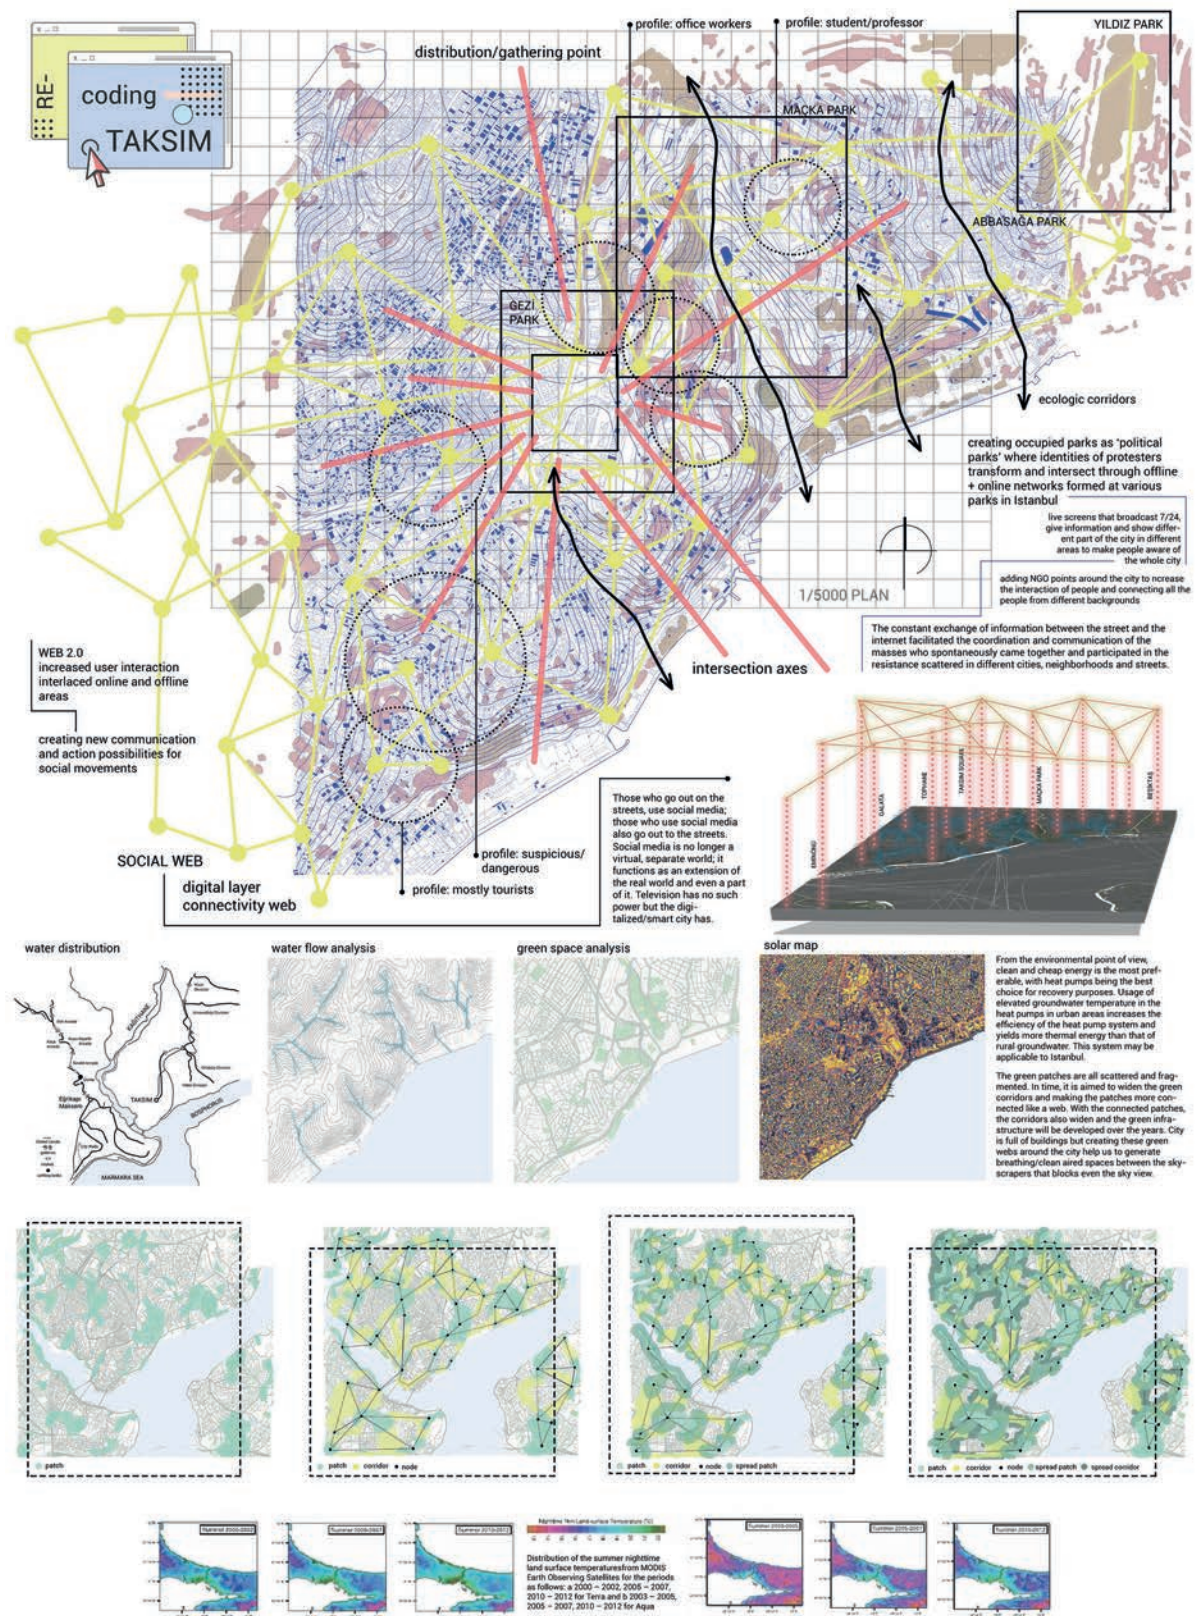

One of the major issues is that Gezi Park, a space where social life accumulates in varying densities, fails to establish sufficient connection with its surrounding areas. This issue is also seen in Taksim Square. Taksim Square, built on the memories of the Republic, is an energy hub and a key urban focal point, deeply embedded in the city's memory, where people gather. However, as the city rapidly developed with advancing technology, the lack of attention to the square's relationship with its environment, combined with the rising vehicle traffic due to population growth and various

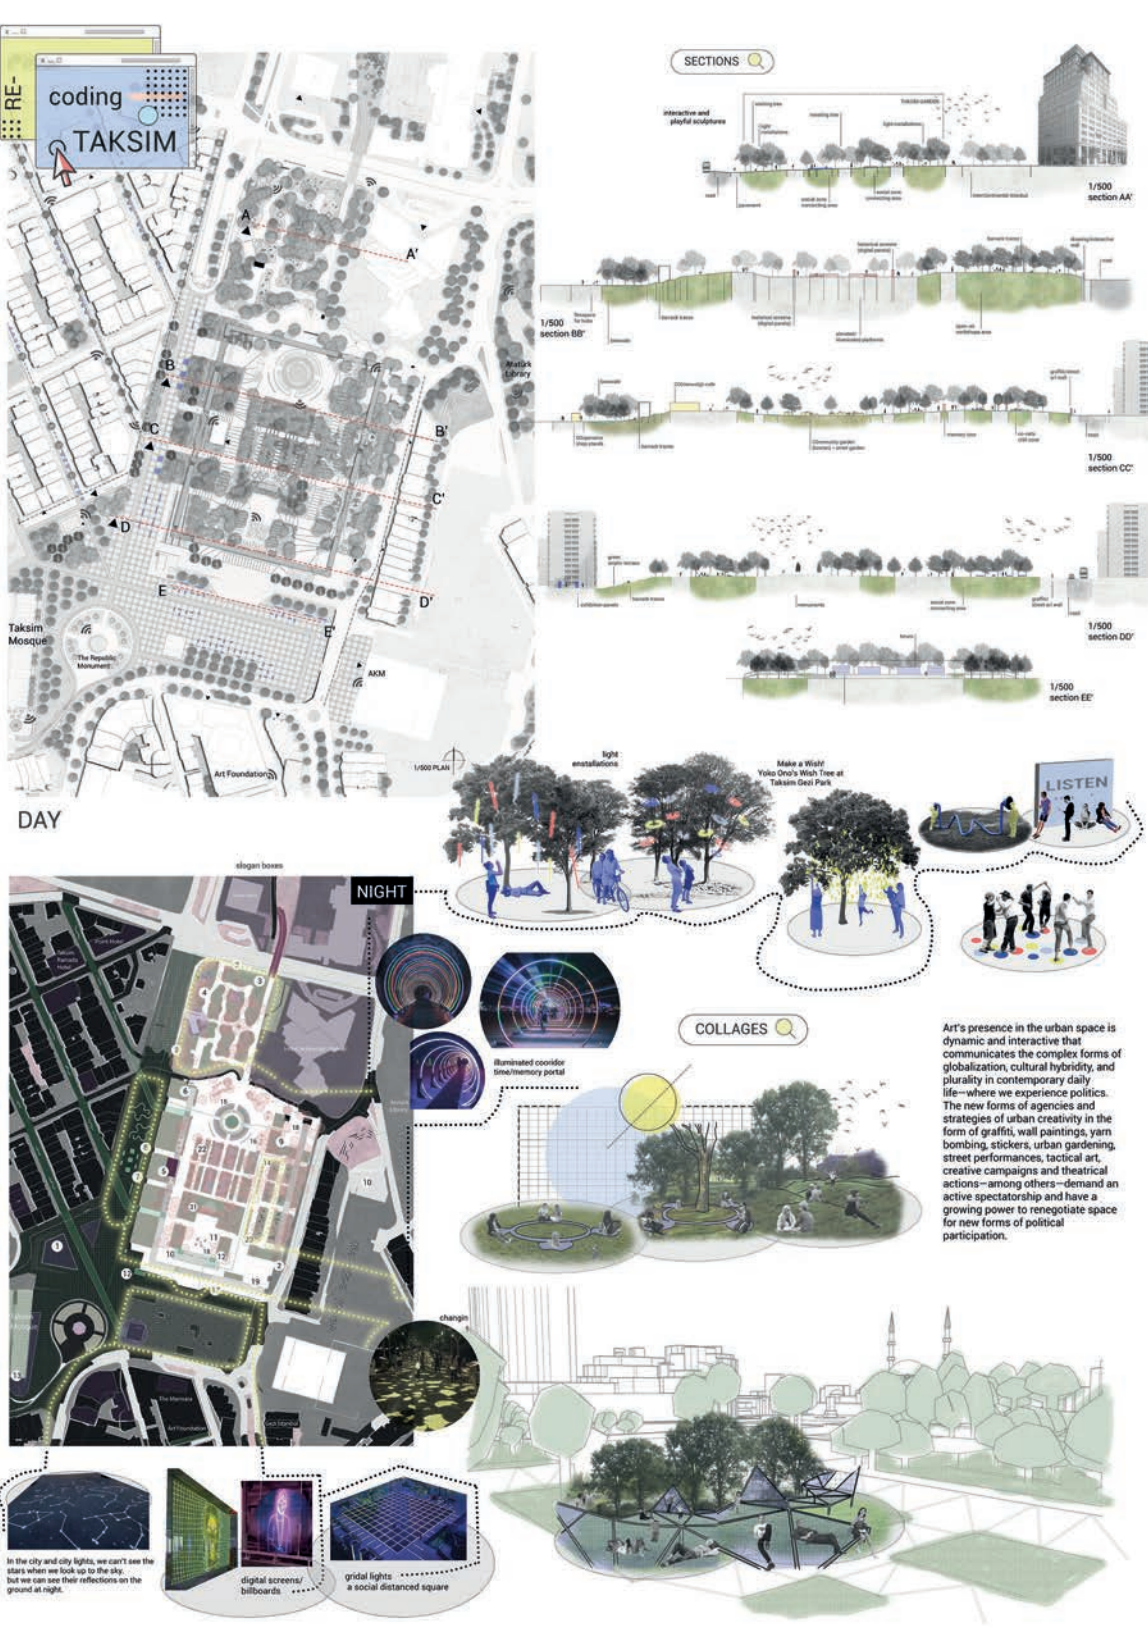

regulations, has transformed the square into a mere intersection, stripping it of its identity. It has become a transit point where people avoid lingering, seeking to escape the crowd, leading to a sense of disconnection.

Thanks to the planned digital layer, we can now experience Taksim virtually, even if we cannot physically be there comfortably. While we may not be able to visit in person, at least our thoughts can reach the square. In essence, the goal is to create a physical space that fosters equality and freedom,

an environment where people can voice their opinions or display their expressions, while also remembering history and shared experiences. Digitally, the objective is for people from Istanbul, Turkey, and even the world, to connect with the square—not physically, but through a digital platform—where they can share their thoughts and interact in this virtual space of freedom. The project was developed with the intention of binding and uniting all aspects of the space.

also sought to foster and deepen human connections over time. The link between the area and its surrounding neighborhoods was reinforced, with functions added at key connection points to make the space more attractive and functional. Green areas, such as Gezi Park and Maçka Park, which are in close proximity, were integrated and connected on a larger scale. A route for education and culture was planned to unite

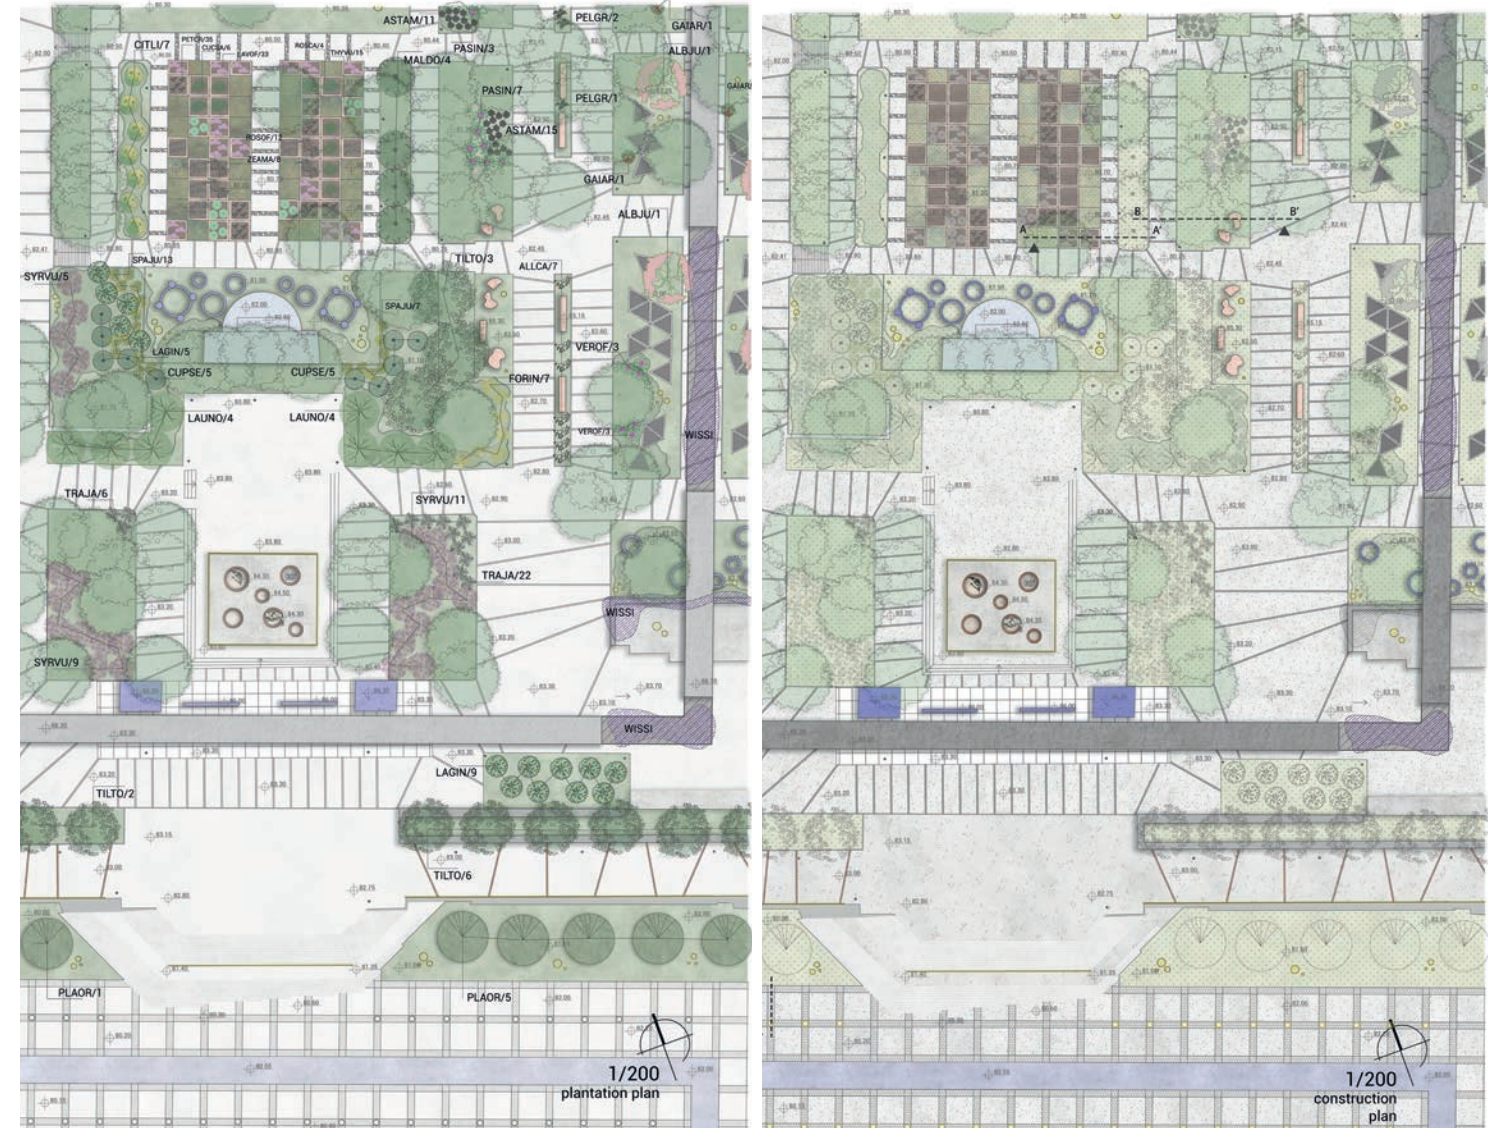

In this project, the bostans (urban gardens) and gardens, which were also included in the Istanbul Master Plan prepared by Prost, were incorporated into the park as a community garden and a smell/butterfly garden. The gardens were designed with a focus on edible and aromatic plants, aiming to make the space more memorable, attractive, and dynamic for visitors by creating smell gardens along the memory route. Seasonal color changes of the plants were carefully considered to add vibrancy throughout the year. Additionally, colors

were used to differentiate spaces based on their functions. The produce from the bostans is intended to be sold at the café and sales areas within the park.

To foster art and creativity, provisions were made for graffiti and artistic activities within the park and the surrounding city. New activities and functions were introduced to replace the negative memories associated with the site. The goal is to transform these unpleasant recollections into new, positive experiences. Many interactive

design elements were added to the park to engage visitors. Furthermore, a digital application was developed for Taksim, offering an opportunity for users—whether physically present or digitally engaged—to participate in the space. The app creates a platform for free expression, where users can listen to podcasts about Taksim, stay updated on news, share photos and memories, and engage in discussions with others, contributing to a more inclusive and dynamic experience.

The spaces in the park have been designed as forums, free thinking and discussion areas, complemented by urban furniture. Movable seating elements and special grid-like areas have been incorporated for various events such as concerts, shows, and celebrations. Foldable structures have been introduced to make the square more flexible and adaptable for events. These structures can be removed after the event, turned back into part of the pavement, and stored. The goal is for these flexible

structures to be easily relocated and used across the entire area when needed. The memory museum in the area was designed as a multifunctional space, serving as storage, public assembly, meeting, planning, and consultation areas. To mitigate the heat island effect, vegetation was added, green spaces were expanded, and bioswale areas were integrated.

The old plans, past experiences, and the overall history of the area were carefully

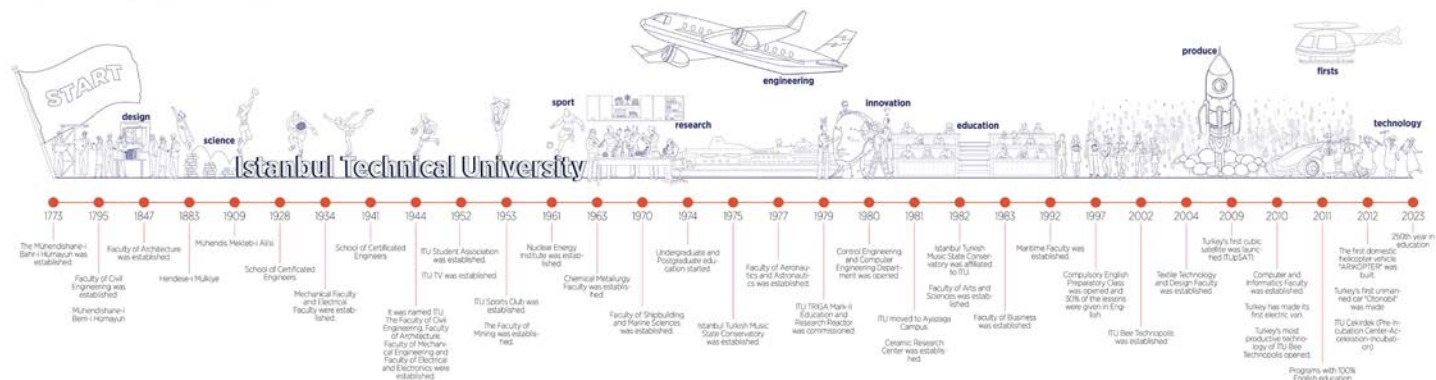

examined and used as inspiration for shaping the new places, routes, and functions. Thanks to thoughtful lighting design, the area now comes alive both during the day and at night. The goal is to seamlessly integrate the past, present, and future with the digital layer. Taksim, which requires an update, had to be digitized to reconnect its past and future, strengthening these connections. Based on these insights, a new design update has been developed and implemented.

Graduation Project/ Urban Campuses of ITU

URBAN CAMPUSES OF ITU

ITU MACKA CAMPUS

Faculty of Management
School of Foreign Languages
Turkish Music State Conservatory
ITU Foundation Offices

In Macka Campus, there are Faculty of Business, English Preparatory School, Language and Revolution History Department, Turkish Music Conservatory, ITU Foundation offices, and ITU Social Facilities. The social facility has a hotel, restaurant, outdoor swimming pool and tennis courts for foreign and domestic guests. There is also a kindergarten and a kindergarten belonging to the university on this campus. The cable car service, which provides the connection between Taskisla and Macka Campuses, offers an important opportunity for ITU students.

ITU TASKISLA CAMPUS

Faculty of Architecture
Fine Arts Department
Social Sciences Institute
Continuing Education Center

In Taskisla Campus, there are the Faculty of Architecture, the Institute of Social Sciences, the Department of Fine Arts and the Continuing Education Center. This campus, which also houses the ITU Development Foundation and the inner city offices of the Rectorate, attracts attention with its magnificent historical building.

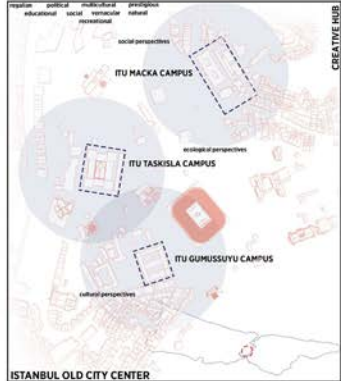

ITU GUMUSSUYU CAMPUS

Faculty of Mechanical Engineering
Fine Arts Department
Social Sciences Institute
Gumussuyu Dormitory for Boys
Gumussuyu Girls' Dormitory

Gumussuyu Campus, together with Taskisla Campus, is in the Taksim area, which was the most important trade and cultural center in Istanbul in the 19th century and maintains the same functions today. On the campus, next to the Machine Faculty, there is an indoor sports hall and open-air sports areas. The dormitory for girls and boys with a total capacity of 266 students, consisting of 2 blocks on the campus, offer ITU students a quality of life beyond the standards.

LOCATION

ITU is a public (state) university. It has five campuses, which are located in the most important areas of Istanbul. Among ITU's five campuses, the main campus of Macka, in Sarıyer, is a suburban campus, covering a total area of 2.64 km². The University Rectorate, swimming pool, stadium, along with most of the faculties, student residence halls and the central library of ITU are located there.

Another suburban campus of ITU is the Tuzla Campus. It serves the Maritime Faculty students and faculty members. It is located in the Tuzla district of Istanbul, which is a dockyard area.

The three urban campuses are near to one another and are situated close to Taksim Square.

Taskisla campus is where the Faculty of Architecture is located. The Taskisla building is one of the most renowned historical buildings in Istanbul. It dates back to the Ottoman era and was used as military barracks.

Gumussuyu (Mechanical Engineering Faculty) and Macka (Management Faculty) campuses are also among the important historical buildings of Istanbul.

Library Services

-ITU's library roughly holds 533,000 books, 500,000 volumes of book periodicals and 6000 rare Ottoman/Latin books. ITU Library has access to international libraries and online databases. It has the largest collection on technical materials (science and engineering) in Turkey. Mustafa İnan Library named after Mustafa İnan, a former rector of the university, is the central library, the coordination center, of the library services of the Technical University. ITU Library Service's history goes back to 1795, the printing house of the Muhendishane-i Berri-i Hümayun of Ottoman Empire.

-ITU Mustafa İnan Library's Rare Books Collection

Triga Mark-2 Nuclear Reactor

ITU's nuclear reactor of Triga Mark-2 is in the Macka campus. It is located at the Energy Institute.

An Technopolis

Since the foundation in 2003 An Technopolis, which is located at the Ayazaga Campus, provides companies with research, technology development and production opportunities at the university in cooperation with the researchers and academicians. The technopolis have two buildings: An-1 and An-2. An-3 building in Maslak and another building in Beşiktaş.

URBAN

BEYOGLU MUNICIPALITY

BEYOGLU REGION

Beyoğlu can be defined as the most Istanbul-smelling district of Istanbul. It is the place where the term cosmopolitan comes to life. Istiklal Caddesi and its surrounding streets can be considered the center of not only Beyoğlu, but also Istanbul. Apart from Istiklal Caddesi, Cumhuriyet, İnkılabı and Çarşı streets are also the places where the commercial and entertainment functions of the district are most prominent. The facilities where various cultural activities are held within the boundaries of the district have made the district a cultural center. Cinemas, theaters, places such as city centers, much of the population has benefited from the Beyoğlu district population living in Istanbul and Turkey in general are expressing a sense of place.

SISLI MUNICIPALITY

SISLI REGION

Sisli, which has many cinemas and theaters, is one of the main cultural centers of Istanbul. The most important institutions in the district are Harbiye Qum Air Theater, Central Rev. Rev. Concert Hall, Lutfi Kadir Congress and Exhibition Center. Apart from these, Harbiye Mühür Etrüf Stage, Gönül Uluç-Gösteri Otzan Theater, Kenter Theater, Harbiye Pocket Theater, Profilo Cultural Center, Studio Theater, Tiyatro and Elit Art House are other theater and performance venues. Sisli, Turkey produces 16% of the economic costs. Finance and Banking, Garment and Textile Chemistry - Pharmaceutical Industry has an important place in domestic and foreign trade and Tourism and industrial distribution. 35% of the Chemical and Pharmaceutical Industry Headquarters in Istanbul, 17% of domestic trade and 15% of foreign trade are located in Sisli, and the rate of 5-star hotels is 60%.

BESIKTAS MUNICIPALITY

BESIKTAS REGION

The district has coastal settlements and internal settlements in terms of geographical location. It is a permanent historic destination due to its being on the shore of the Bosphorus and its historical texture. Thanks to the theater, cinema and cultural centers, sociocultural life is always active in the district. In 3 cultural centers belonging to our Municipality, cinema and theater performances as well as panels and various concerts are carried out.

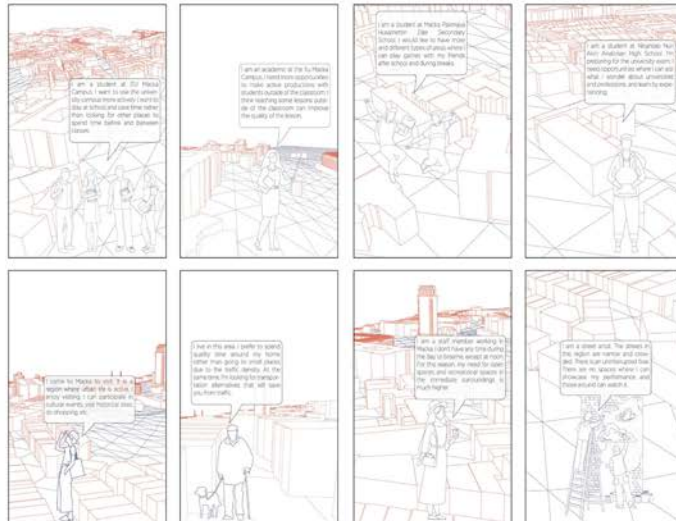

The district has a vibrant and very lively business life. 130 thousand small shopping centers, 2 thousand company headquarters, 85 bank branches, institutions operating in the capital market, shopping centers in accordance with European standards, plazas and international hotel businesses, as well as Nobel and Pfizer. The district plays an important role with its pharmaceutical factories and Yedigöller businesses.

entrepreneurs, students, city residents, and administrative groups collaborate to create studies that shape the future of the city and contribute to international scientific standards. The dissemination of these studies is facilitated through various channels, including the city council, mobile applications, social media, ITU Radio, and a dedicated website.

The area studied in this project holds historical and urban significance. Maçka Democracy Park, situated at the intersection of three campuses, stands out as the largest green space in the region, offering substantial ecological potential. The goal of the project is to develop spatial strategies and solutions that are mindful of the park's sensitive nature. The Patch-Corridor-Matrix model was applied, considering the issues identified at the 1/2000 scale and the proposed solutions derived from this conceptual approach. This method was maintained at both the 1/500 and 1/200 scales. In the 1/500 plan, the focus was placed on the Taşkısla Campus, the urban gap between the campuses, the Gümüşsuyu Campus, and the Atatürk Library. At the 1/200 scale, Taşkısla Campus was chosen as the core area, with eco-friendly co-working spaces developed both within and around Taşkısla. The project also integrates areas where people from diverse backgrounds can socialize and contribute to the Urban Laboratory, alongside shared working spaces.

ITU TASKISLA CAMPUS AND SURROUNDINGS USER PROFILES

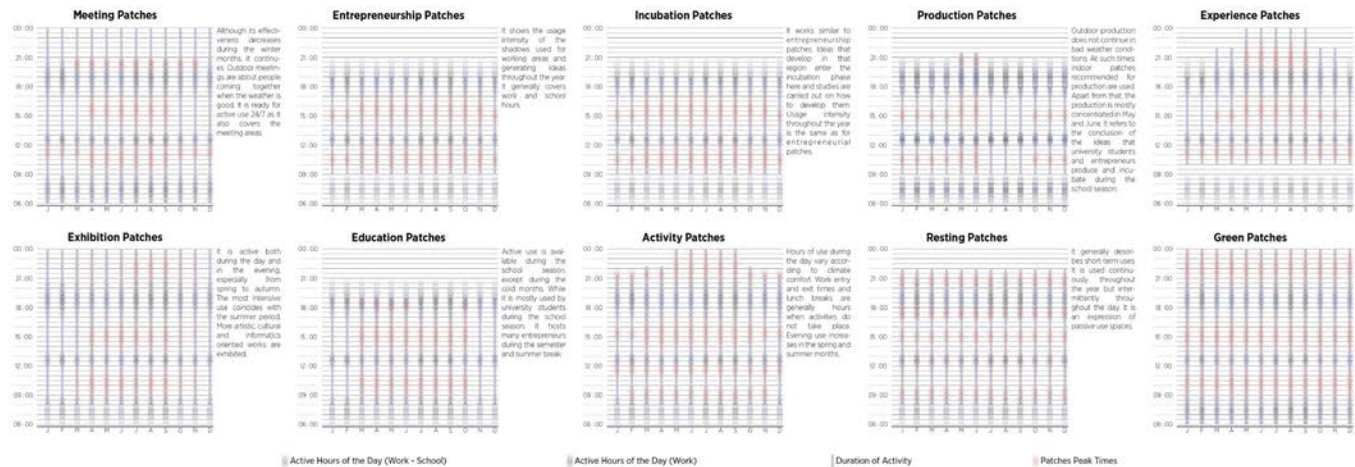

ITU GUMUSSUYU CAMPUS AND SURROUNDINGS USER PROFILES

DENSITY ANALYSIS OF PATCHES

The Urban Laboratory is an initiative that fosters interaction between the university and the city, working to create collaborative solutions to urban challenges by leveraging the resources of both. It serves as a city infrastructure that unites all relevant stakeholders—city officials, university

members, and the local community—through participatory project development. This collective effort addresses the paradigms of urban living, encouraging productivity, connecting entrepreneurs with shared objectives, and rewarding successful ideas by linking them with angel

investors. By extending education and innovation beyond institutional walls and into the broader city, the initiative facilitates the testing and advancement of scientific ideas in direct connection with social life.

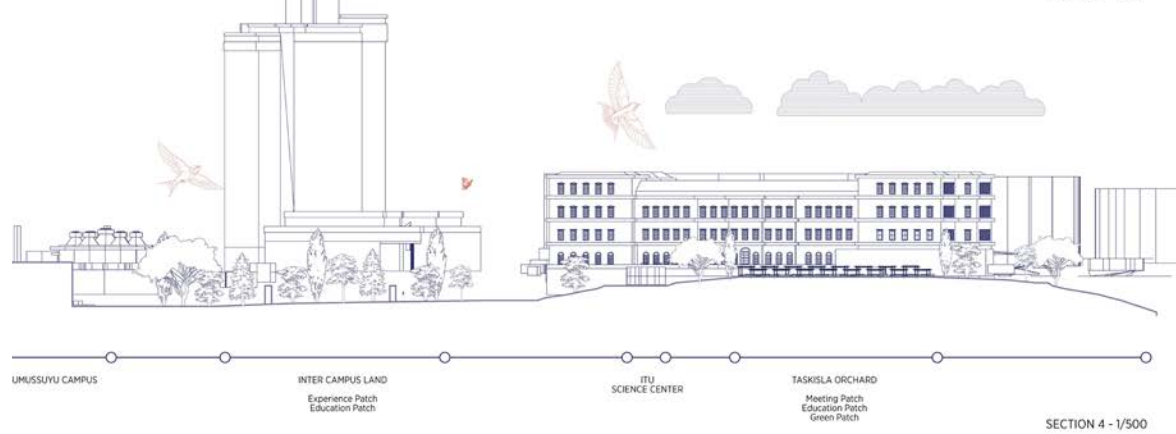

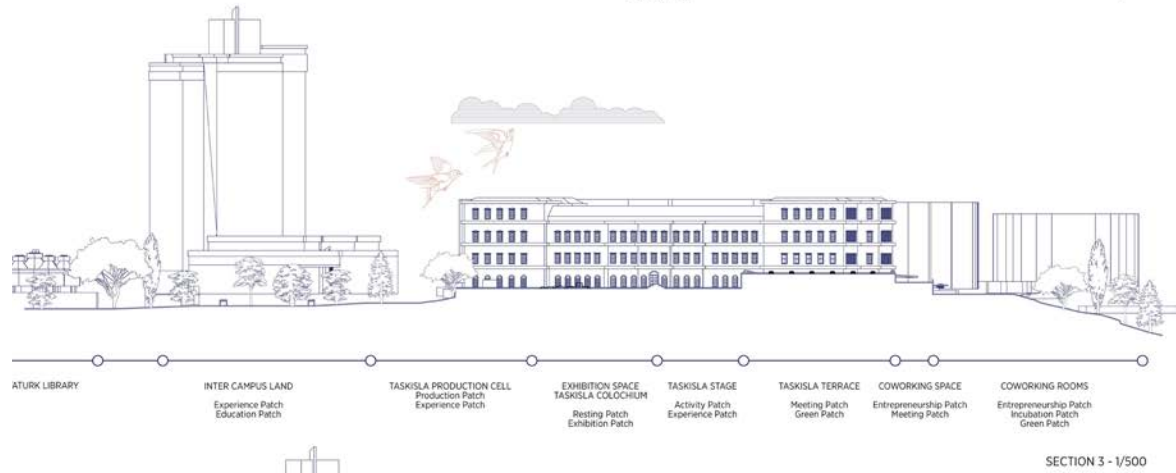

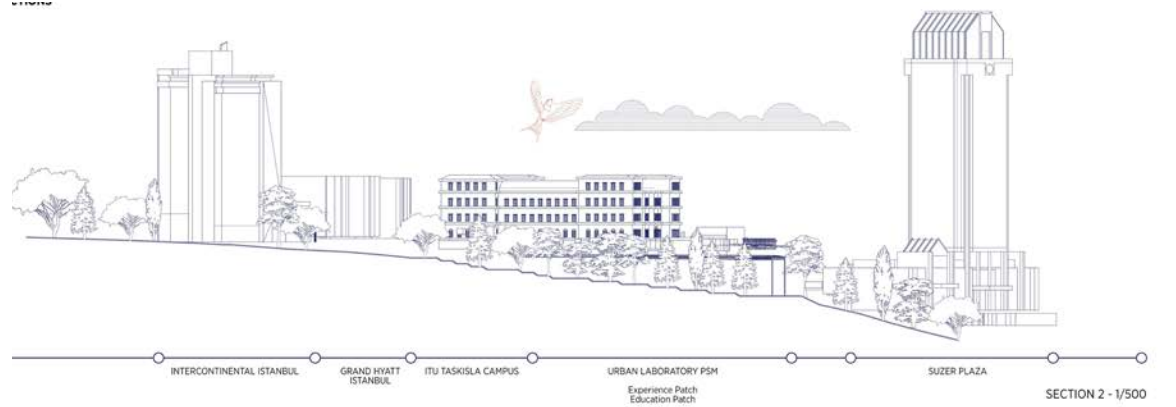

The ITU URBAN LABORATORY Project, to be implemented through the collaboration between Istanbul Technical University and the Istanbul Metropolitan Municipality, aims to address urban challenges while hosting the scientific knowledge generated by the university. The involvement of other

universities in these studies, along with the publication of the outcomes from the urban laboratory at both national and international levels, will offer solutions to urban issues globally. This approach will strengthen social relations, provide opportunities for development-focused

individuals in the city to connect, and enhance the overall welfare and education levels. The project will bring together all segments of society to create rich, diverse content.

The Urban Laboratory, developed to enhance the interaction between the university and the city, aims to leverage existing potentials and generate scientific

solutions to urban challenges. It will serve as the hub for innovative ideas and processes, addressing complex urban issues through collaborative efforts. In

this process, the city's history and culture, its infrastructure, and the young, dynamic university population with their science-driven capabilities will be harnessed.

The 1/500 scaled study area includes central areas like the Tennis, Marriage, Office, Library, and Plaza. As you approach the Plaza park, the slope increases and becomes a hill.

Design proposals have been developed to support the existing layout. The proposals are based on the existing layout and the need to create a more integrated and functional space.

In order to be suitable for the current use of the area, a design was tried to be developed without interfering too much with the ground. The main goal of this design is to improve the green zone and combine its potentials with the Urban Laboratory program.

URBAN LABORATORY PISH which was created by evaluating the space between the city campus, with the landscape and the city in the Urban Laboratory project.

It represents a cross-section of individual study areas. It has been developed for an experimental and incubation patches with the design approach, working spaces that do not disturb the space but help the topography are produced.

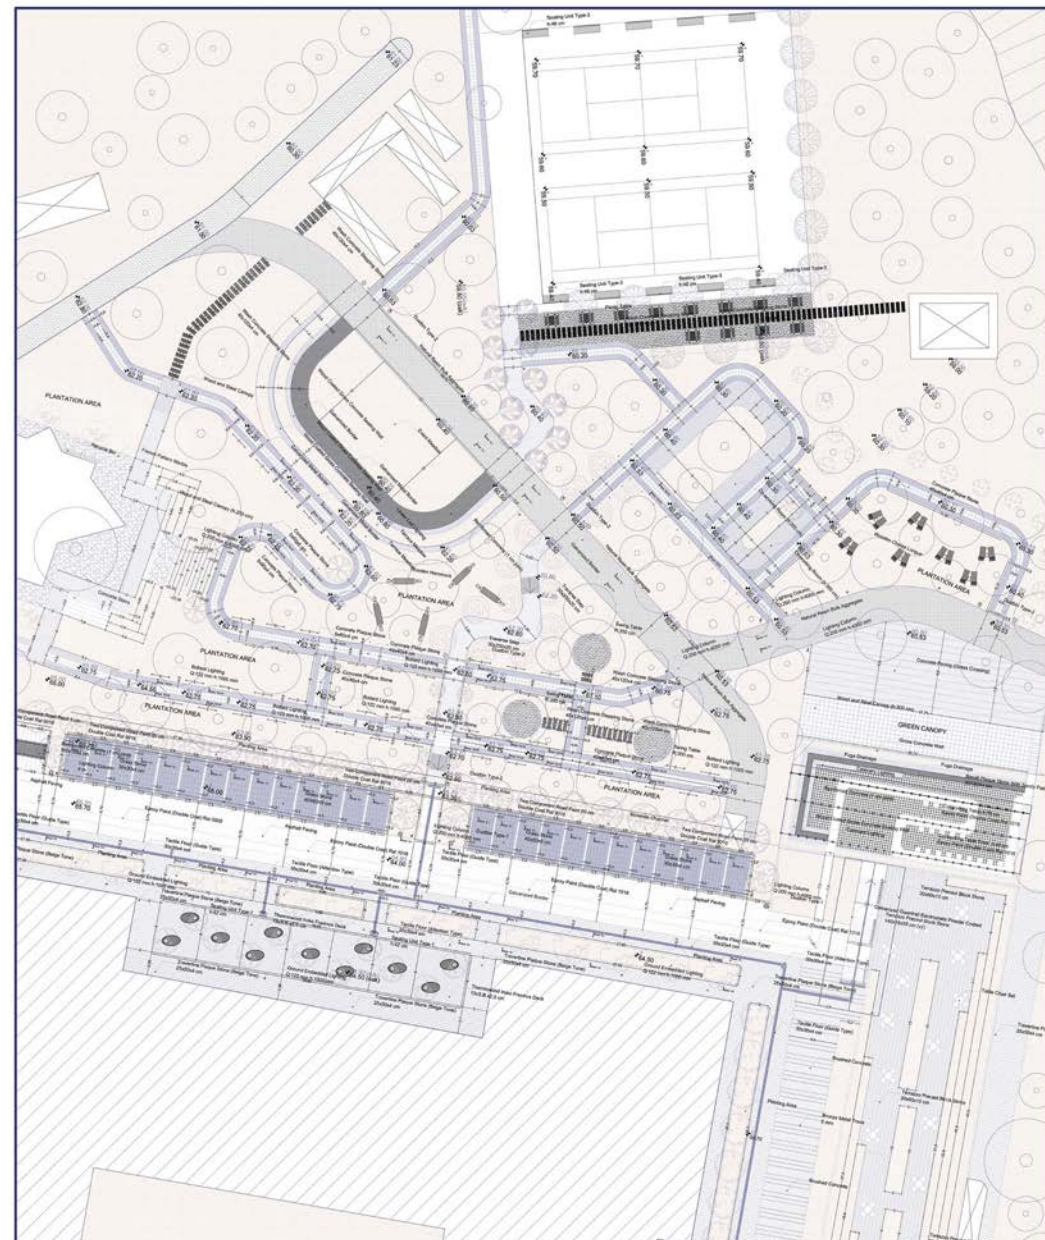

The basic principle of the swing table is to create a more functional working area by separating the trees in the background of the area into the design. For this reason, there are large gaps in the middle of the table where the new park can easily be.

URBAN LABORATORY LANDSCAPE PROJECT - 1/200 HARDSCAPE PLAN

A1

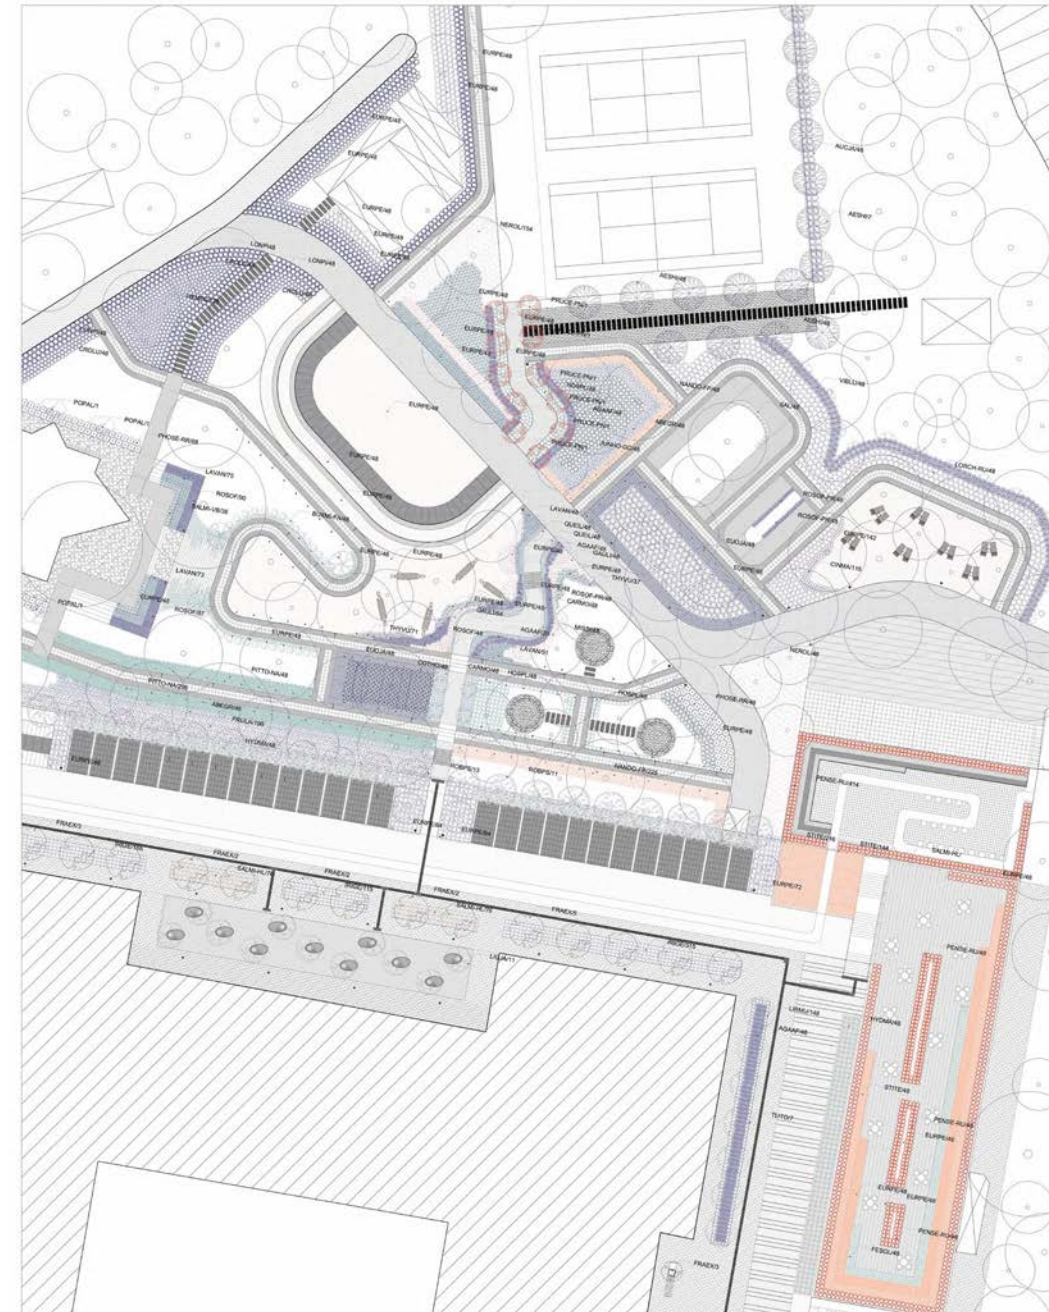

- Thermowood Iroko Fraxinus Deck (13x5.8x2.5 cm)
- Travertine Plaque Stone (Beige Tone) (25x50x4 cm)
- French Pattern Marble (Hukuk Silver Set)
- Grass Stone (40X60X9 cm)
- Terrazzo Precast Block Stone (40X60X9 cm)
- Basalt Plaque Stone With Sandy Patina (30X30X4 cm)
- Asphalt Paving
- Reinforced Concrete (1 cm joint)
- Natural Resin Bulk Aggregate
- Compressed Soil with Solution
- Traverse Step (30x20x20 cm)
- Concrete Plaque Stones
- Concrete Stairs
- Granite Plaque Stone (30x30x4 cm)
- Mulch
- Wash Concrete Stepping Stone (40x120x4 cm)
- Epoxy Paint (Double Coat) Ral 1018
- Terrazzo Precast Stairs
- Two Component Road Paint 20 cm
- Concrete Grey Ceramic (70x100x1 cm)
- Wood and Steel Canopy
- Brushed Concrete
- Concrete Paving (Grass Crossing)

Re-Connect

Ezgi Akpınar

“Re-Connect” was produced within the scope of Graduation Project carried out by Prof. Dr. Hayriye Eşbah Tunçay, Prof. Dr. F. Ayçim Türer Başkaya, Assist.Prof. Dr. İkhwan Kim, Assoc. Prof. Dr. Saye Nihan Çabuk, and Assoc. Prof. Dr. Saitali Köknar and assisted by Res. Assist. Gizem Aluçlu and Res. Assist. Başak Akarsu under the title “Urban Campuses of ITU” in the spring semester of 2020-2021.

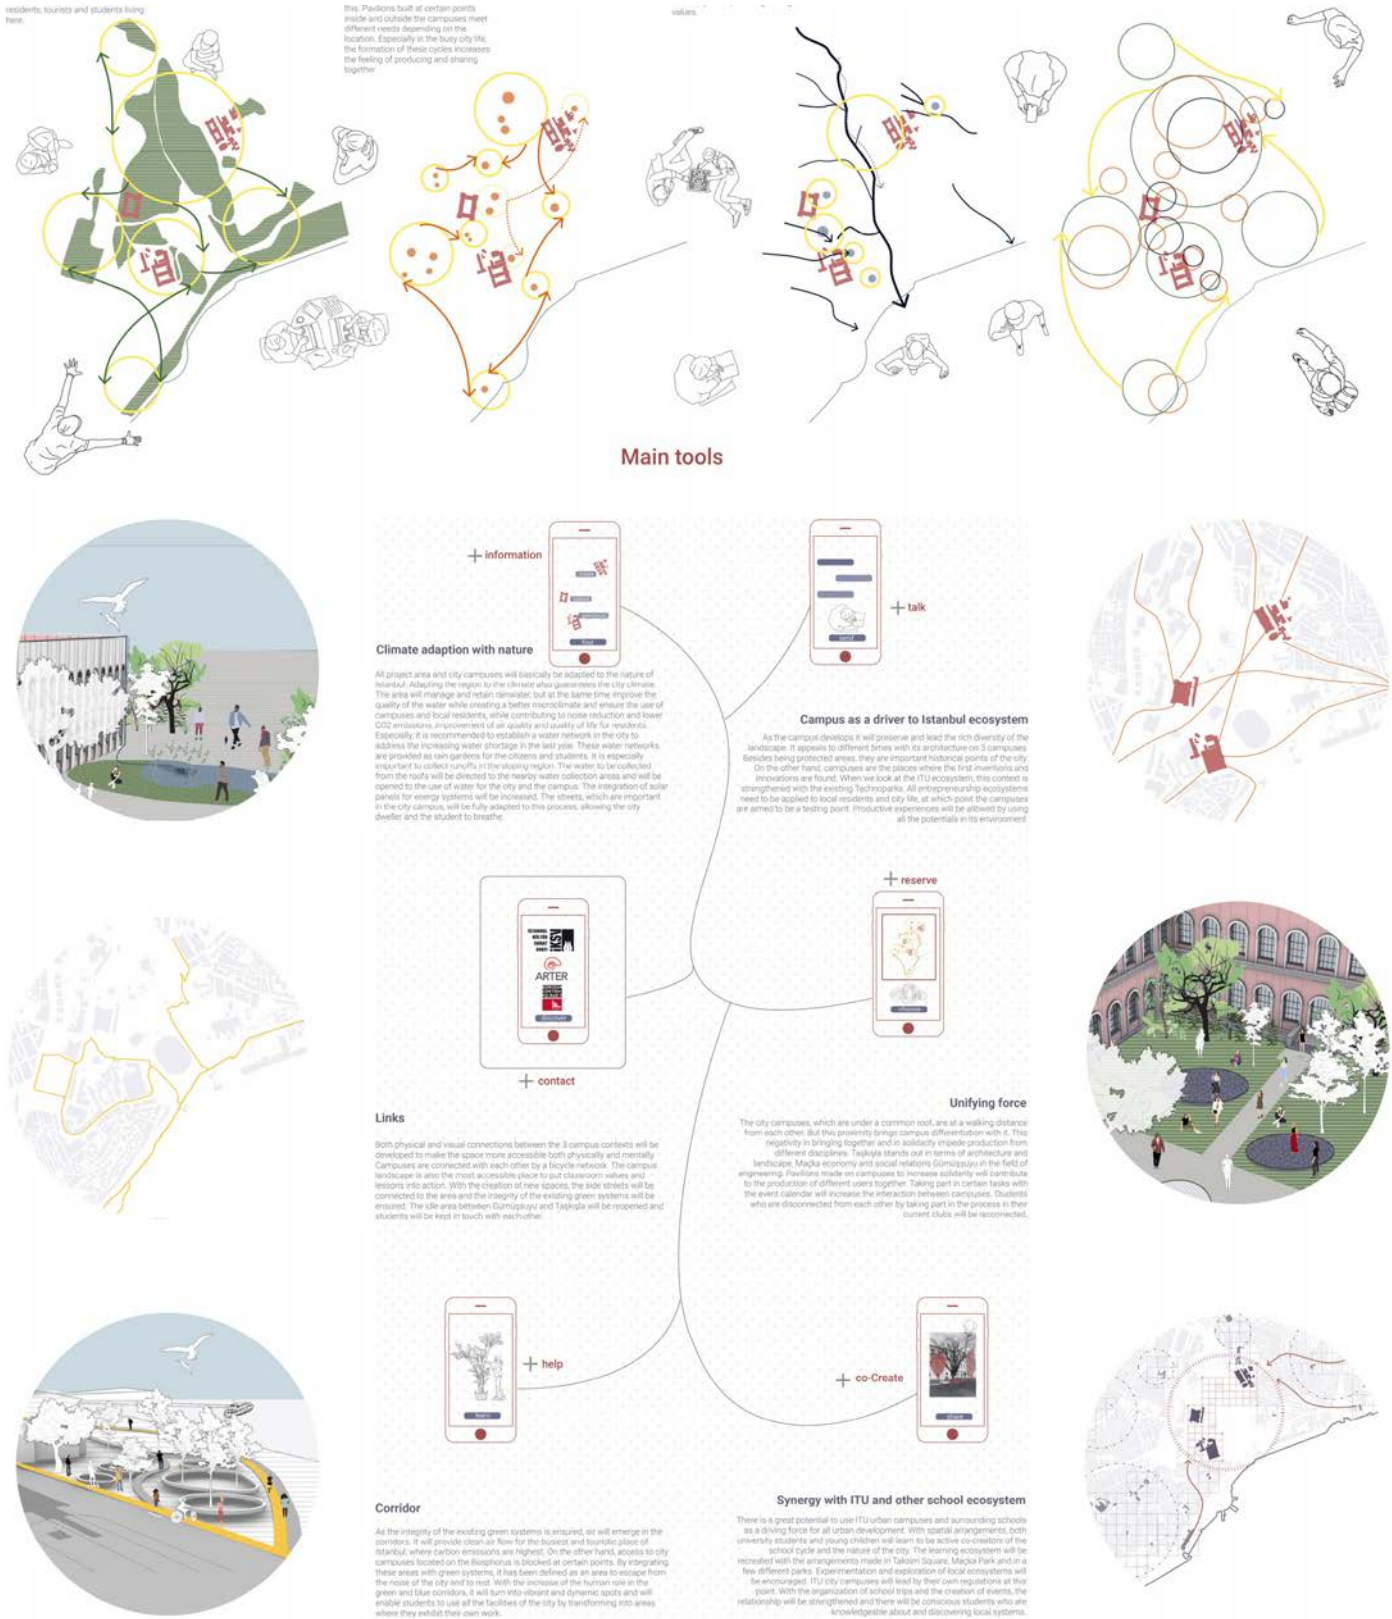

* TMMOB Chamber of Landscape Architects · 9th Landscape Architecture Students Graduation Project Awards Equivalent Award

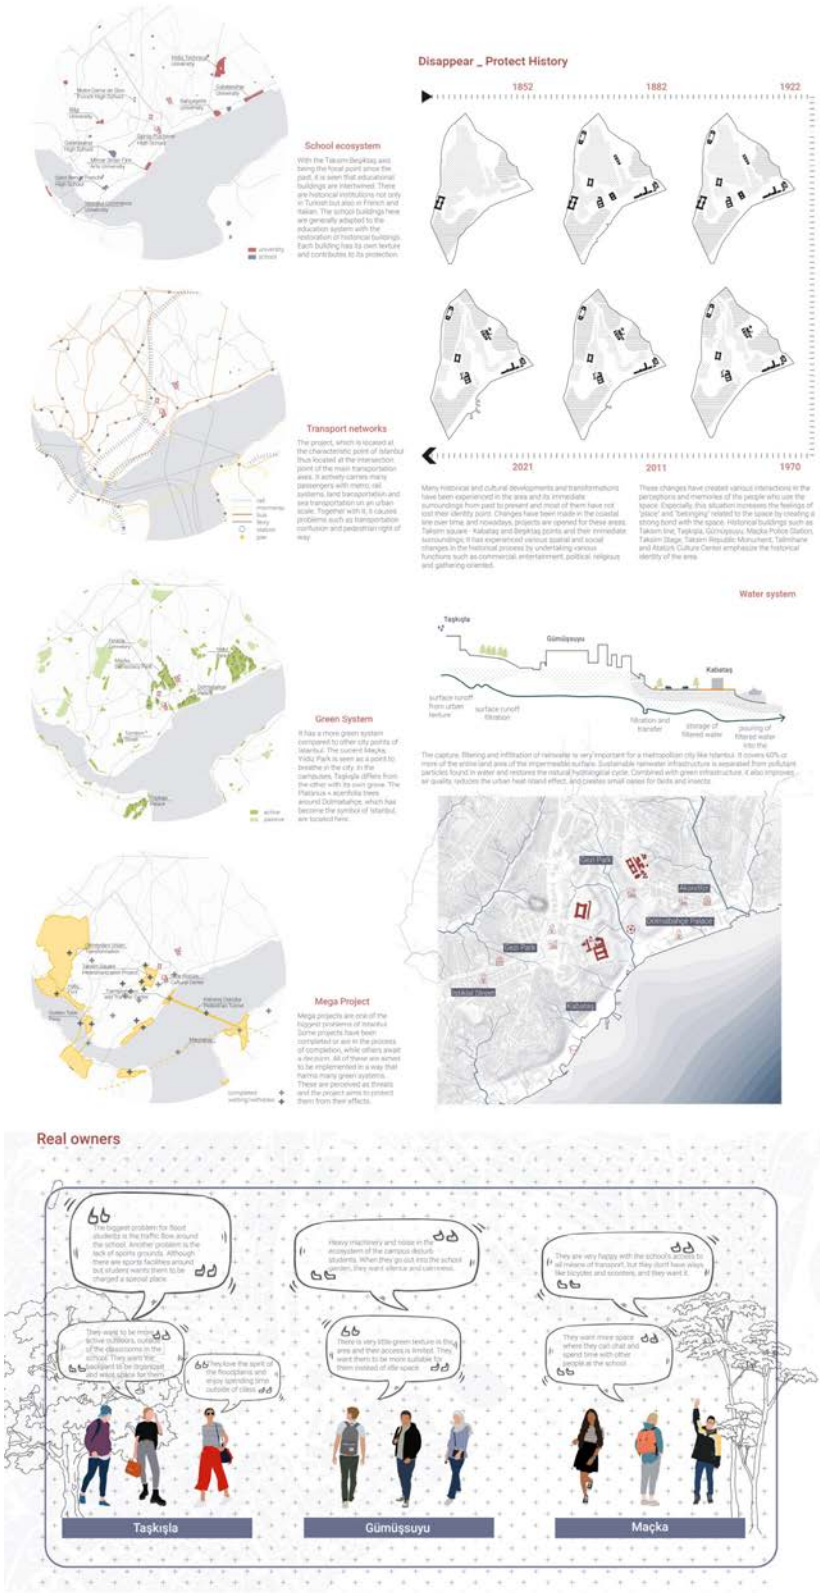

The Re_Connect project focuses on creating local urban area solutions that strengthen the campuses’ locations while simultaneously addressing global climate challenges. As the student population has grown over time, the sense of unity and

belonging among students has diminished. The term “re-connect” originates from the cooperation and interdisciplinary processes that were a fundamental part of early education systems, where students worked together under a single roof. Today,

with the growing student population and the introduction of campus concepts, these interdisciplinary processes have weakened. The project aims to rekindle the sense of togetherness and cooperation through cycles of engagement.

The project aims to contribute to city life by creating a framework that adapts to the changing environment and people. It leverages co-creation, ownership, and the social diversity of the community and region as its strengths. By enhancing the natural characteristics of the city and strengthening biodiversity, the project also contributes to the unique spirit of the region. Taşkılla, Maçka, and Gümüşsuyu, the city campuses of Istanbul Technical University (ITU), encourage reconnection between each other and with other systems. The goal of the project is not only to provide solutions for ITU campuses but also to make a positive impact on their surroundings. This process has been supported by creating arrangements that support cycles, such as transport, flow, green system, blue system, activities, and innovation systems. By combining circulation and activities, connections were made between the three campuses. Activities were chosen based on six key tools that had been defined beforehand, ensuring that the environment fully engages the user.

Transportation

Taksim-Bespiktay line, located in the middle of Istanbul, is home to intense transportation vehicles. A balance must be created between both pedestrian and vehicle traffic. Scooter rental points have been proposed for the field. In addition, by proposing a suitable route for bicycle traffic, a loop route between Taşköprü - Mada - Güneşli campuses was proposed and campuses were connected.

Circulation

It has been proposed with the necessary width of pavement for pedestrians in the necessary arrangements for circulation. At some points, pedestrian and vehicle traffic mix with each other. It is aimed to relieve vehicle traffic by bringing intersection suggestions especially for Taşköprü and its surroundings. Since Taksim and the campuses are places with heavy pedestrian traffic, a speed limit has been imposed for vehicles. Uninterrupted pedestrian traffic is supported.

Green system

The field is home to many green systems. The necessary regulations not only propose new systems, but also maintain their current form. While maintaining the green system, it is aimed that the field be used by the users.

Istanbul is dependent on surface water resources. Changes in temperature and precipitation regime caused by climate change make it difficult to meet the increasing demand of the increasing population of the city. Pressures on water resources can threaten water security due to decreasing precipitation, evaporation with increasing temperatures, decrease in the amount of surface water, and prolongation of drought periods.

Month-to-month water harvesting

Activities

Many systems in the field are aimed to connect with the user. Suggested activities are aimed at students, locals and tourists. The area that connects with many users brings many innovations to the user. Outdoor activities support the spirit of the region and the continuity of green systems is also ensured by activities.

Water system

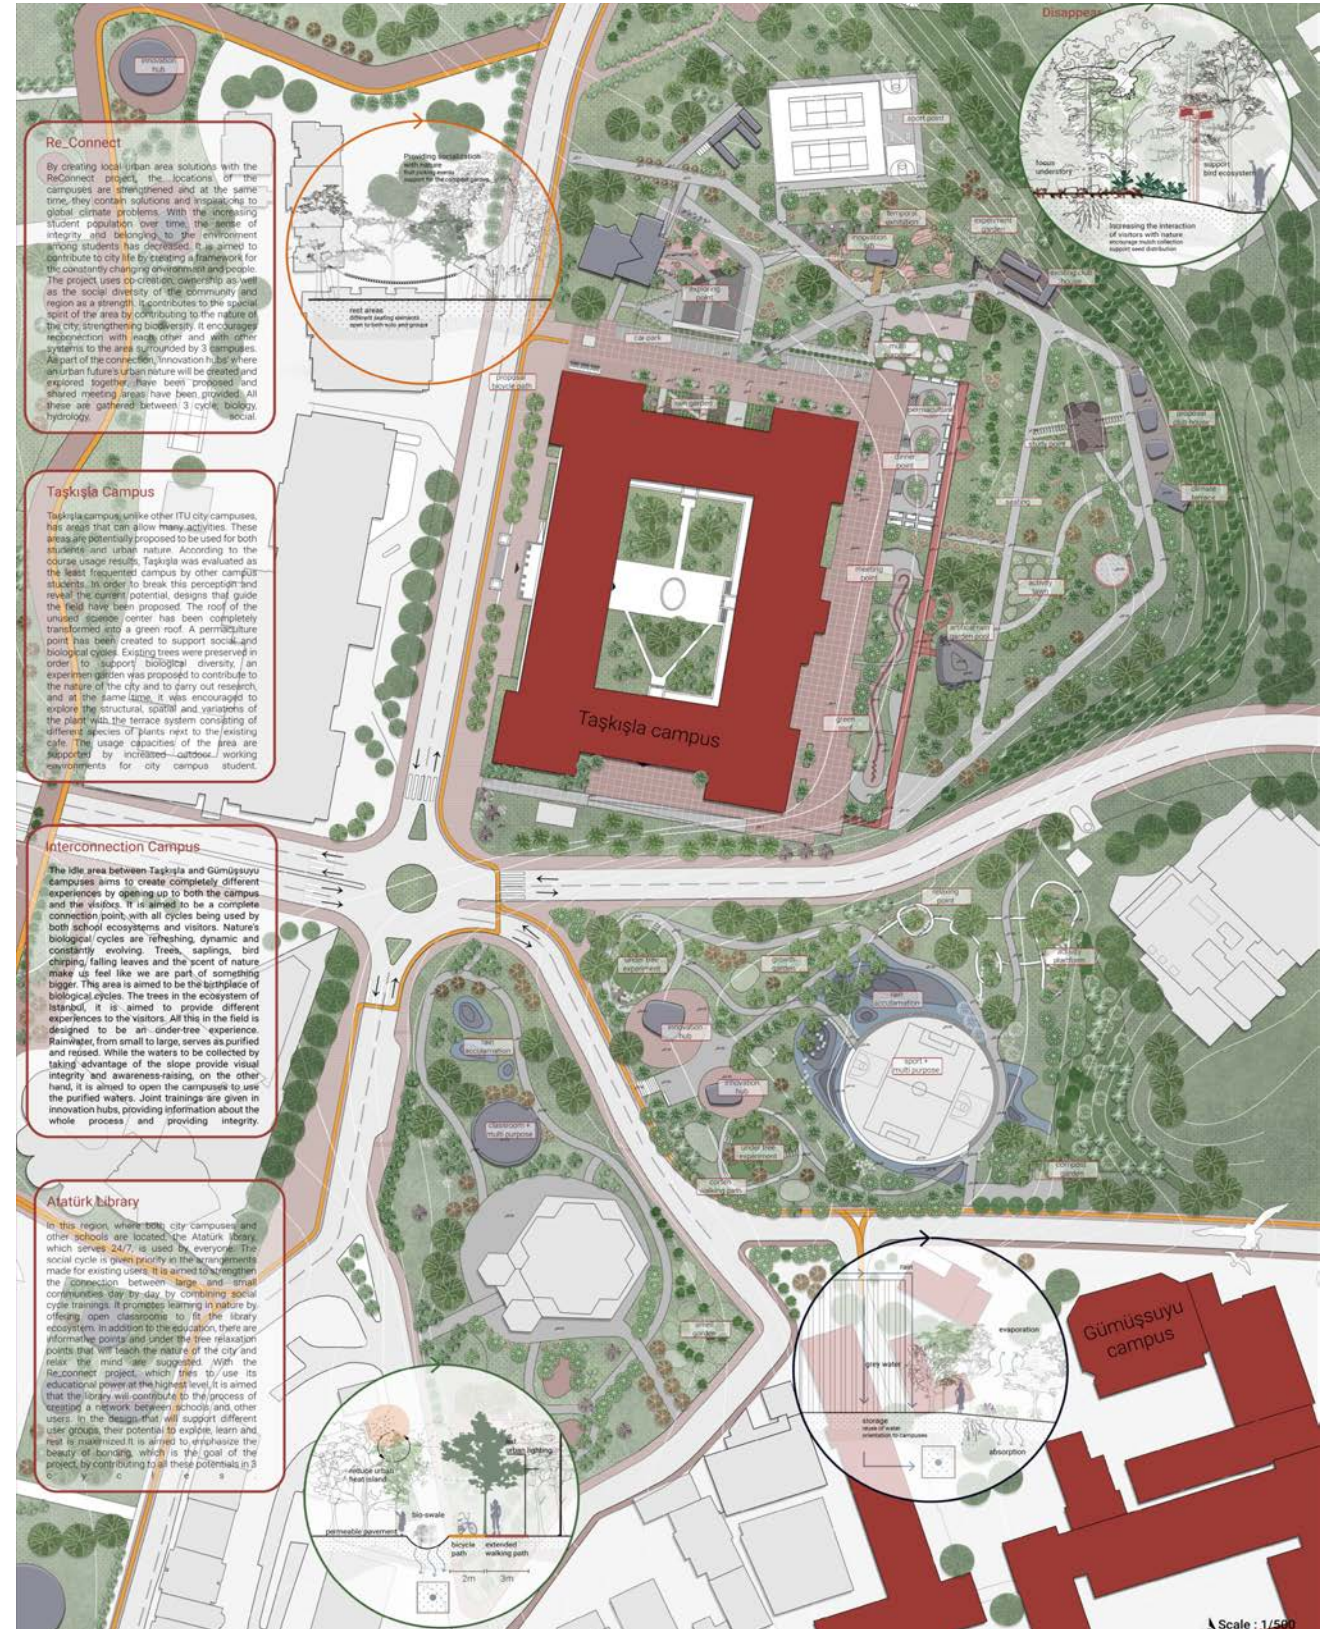

Many systems in the field are aimed to connect with the user. Suggested activities are aimed at students, locals and tourists. The area that connects with many users brings many innovations to the user. Outdoor activities support the spirit of the region and the continuity of green systems is also ensured by activities.

Innovation system

The area has many school ecosystems. At the suggested points, it has been turned into places where school activities can be held and interact with the green system more. In this way, awareness will be raised on issues such as the climate crisis. Innovation points scattered over many points will be open to the public. One of these points has been adopted as Taşköprü.

With the proposed water collection area, it raises awareness about how water can be collected in the center of Istanbul. With the calculated area and precipitation capacity, water can be collected in every season in the area, and it is arranged to be transferred to the underground water tanks at the points where the area is insufficient. In this way, the accumulated water will be home to the creatures there, and at the same time it is aimed to be used between campuses. By using one of the main tools, climate adaptation with nature, ITU campuses are aimed to be a pioneer for other schools.

Re-Connect

By creating local urban area solutions with the ReConnect project, the locations of the campuses are strengthened and at the same time, they contain solutions and responding to global climate problems. With the increasing student population over time, the sense of integrity and belonging to the environment working students has decreased. It is aimed to contribute to city life by creating a framework for the constantly changing environment and people. The project users co-creation ownership as well as the social diversity of the community and region as a strength. It contributes to the special spirit of the area by contributing to the nature of the city strengthening biodiversity. It encourages reconnection with each other and with other systems to the area surrounded by 3 campuses. As part of the connection, innovation hubs where urban future's urban nature will be created and explored together, have been proposed and shared meeting areas have been provided. All these are gathered between 3 cycles: social, hydrology.

Taşköprü Campus

Taşköprü campus, unlike other ITU city campuses, has areas that can allow many activities. These areas are potentially proposed to be used for both students and urban nature. According to the course usage results, Taşköprü was evaluated as the least frequented campus by other campus students. In order to break this perception and reveal the current potential, designs that guide the field have been proposed. The roof of the unused sports center has been completely transformed into a green roof. A permeability point has been created to support social and biological cycles. Existing trees were preserved in order to support biological diversity. An experiential garden was proposed to contribute to the nature of the city and to carry out research, and at the same time, it was encouraged to explore the structural, spatial and varieties of the plant with the terrace system consisting of different species of plants next to the existing cycle. The usage capacities of the area are supported by facilitated outdoor working environments for city campus student.

Interconnection Campus

The idea area between Taşköprü and Güneşli campuses aims to create completely different experiences by opening up to both the campus and the visitors. It is aimed to be a complete connection point with all cycles being used by both school ecosystems and visitors. Nature's biological cycles are refreshing, dynamic and constantly evolving. Trees, saplings, bird chirping, falling leaves and the scent of nature make us feel like we are part of something bigger. This area is aimed to be the birthplace of biological cycles. The trees in the ecosystem of Istanbul, it is aimed to provide different experiences to the visitors. All this in the field is designed to be an 'under-tree' experience. Rainwater, from small to large, serves as purified and reused. While the waters to be collected by taking advantage of the slope provide visual integrity and awareness-raising, on the other hand, it is aimed to open the campus to use the purified waters. Joint trainings are given in innovation hubs, providing information about the whole process and providing integrity.

Atatürk library

In this region, where 100% city campuses and other schools are located, the Atatürk library which serves 24/7, is used by everyone. The social cycle is given priority as the arrangements made for existing users. It is aimed to strengthen the connection between large and small communities day by day, by combining social cycle trainings. It promotes learning in nature by offering open classrooms to the library ecosystem. In addition to the education, there are informative points and under the tree relaxation points that will teach the nature of the city and relax the mind as suggested. With the ReConnect project, which tries to use its educational power at the highest level, it is aimed that the library will contribute to the process of creating a network between schools and other users. In the design that will support different user groups, their potential to explore, learn and rest is maintained. It is aimed to emphasize the beauty of bonding, which is the goal of the project, by contributing to all these potentials in 3

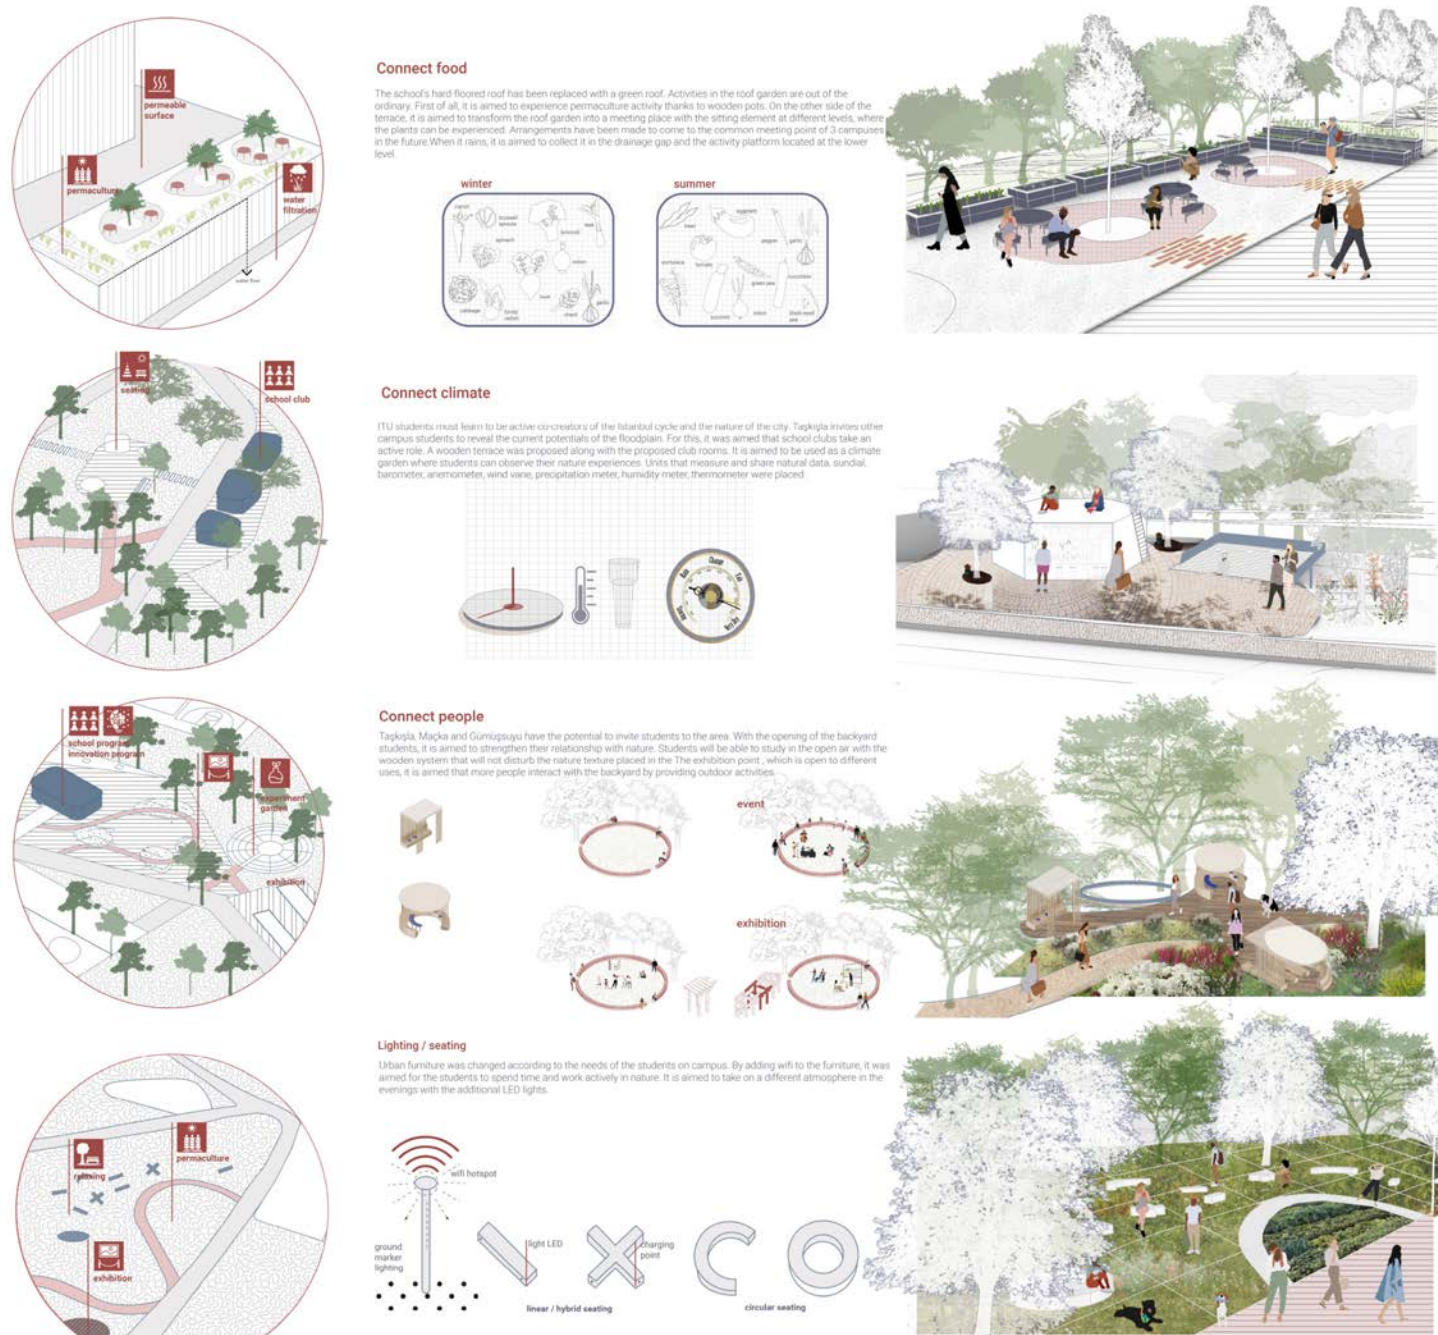

Disappearing

increasing the interaction of visitors with nature ecosystem water collection support used distribution

storage rain water observation to campuses absorption

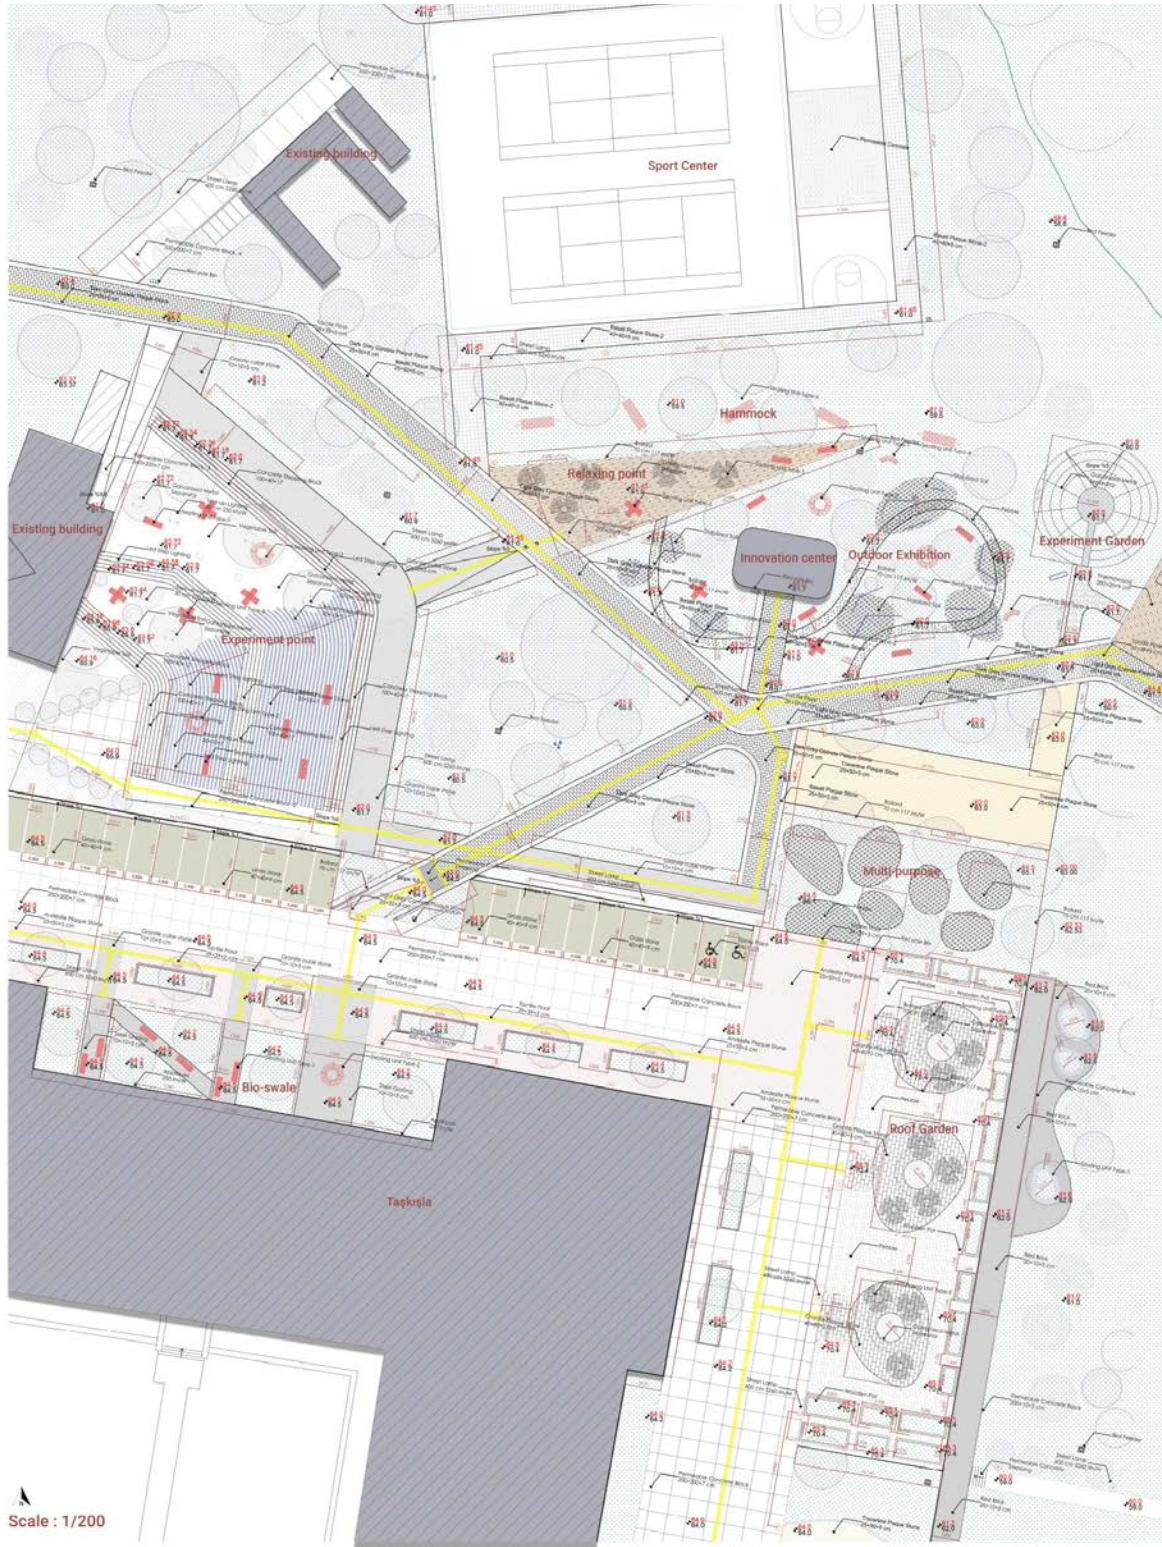

The project begins with cycles that are interconnected through the principles of adhesion and cohesion. Cohesion binds similar substances, while adhesion binds different substances together. Three cycles have been created for a sustainable campus: hydrological, social, and

biological. These cycles are linked through the concept of adhesion and cohesion. When examining the main tools, the design has been aligned with sustainable campus principles. Six key tools were identified: harmony with nature through climatic solutions, links and corridors, campuses

acting as drivers for Istanbul's ecosystems, unifying power, and synergy with ITU and other educational ecosystems. As the design progresses into the lower layers of the biological, hydrological, and social cycles, various points in landscape planning are explored.

Cycle with social and hydrological _ experiment garden

The climate is changing, rains are falling heavier, on the other hand, drought lasts longer. While these two points form the innovation part of the project, they unite the hydrological, social and biological cycles. The experimental garden located in Taşkışla campus is designed to learn what parameters it brings to the city in planting design. Different lands and different practices in the city have been studied and the most relevant ones are integrated into the design. For this, experiments are carried out with soil compositions, planting types and runoffs. These experiments are aimed to be used in different application areas of the city in the future. On the other hand, they will be able to support the experimental process by owning the tasks in the proposed application so that their students can interact.

Social cycle

Diversity in vegetation

Vegetation is arranged in multiple layers re-connect and explain understory throughout the environment.

The understory is the underlying layer of vegetation in a forest or wooded area, especially the trees and shrubs growing between the forest canopy and the forest floor. With the decreasing green tissue day by day, many plant and animal species are also decreasing. It is designed to consider not only the top of the earth but also the gold. Different vegetation types have been introduced as a suggestion and it is aimed to keep biodiversity at a high level.

Top cover and bottom cover work together. Students, local residents and tourists have been informed more about the subject with the planting design that will lead the campus and its surroundings. A special sense of belonging to the place has been created with the selection of the vegetation species belonging to Istanbul. Different vegetation has been used to create the necessary nutrients for underground plants. All these bring together the integrated landscape system.

Material Legend

Symbol	Name	Width	Unit	Number
	Andesite Plaque Stone	25x50x5	m³	336
	Basalt Plaque Stone - 1	25x50x5	m³	135
	Basalt Plaque Stone - 2	40x40x5	m³	189.6
	Basalt Plaque Stone - 3	30x10x7	m³	60.2
	Concrete Plaque Stone Dark Grey	25x50x5	m³	467
	Concrete Plaque Stone Light Grey	25x50x5	m³	93.75
	Concrete Stepping Stone	100x40x17	m³	117
	Galvanized Metal Separator		m³	35
	Granite Plaque Stone	40x80x5	m³	185

Carnavalesque

İrem Güvenç

“Carnavalesque” was produced within the scope of Graduation Project carried out by Prof. Dr. Hayriye Eşbah Tunçay, Prof. Dr. F. Ayçim Türer Başkaya, Assist.Prof. Dr. İkhwan Kim, Assoc. Prof. Dr. Saye Nihan Çabuk, and Assoc. Prof. Dr. Saitali Köknar and assisted by Res. Assist. Gizem Aluçlu and Res. Assist. Başak Akarsu under the title “Urban Campuses of İTÜ” in the spring semester of 2020-2021.

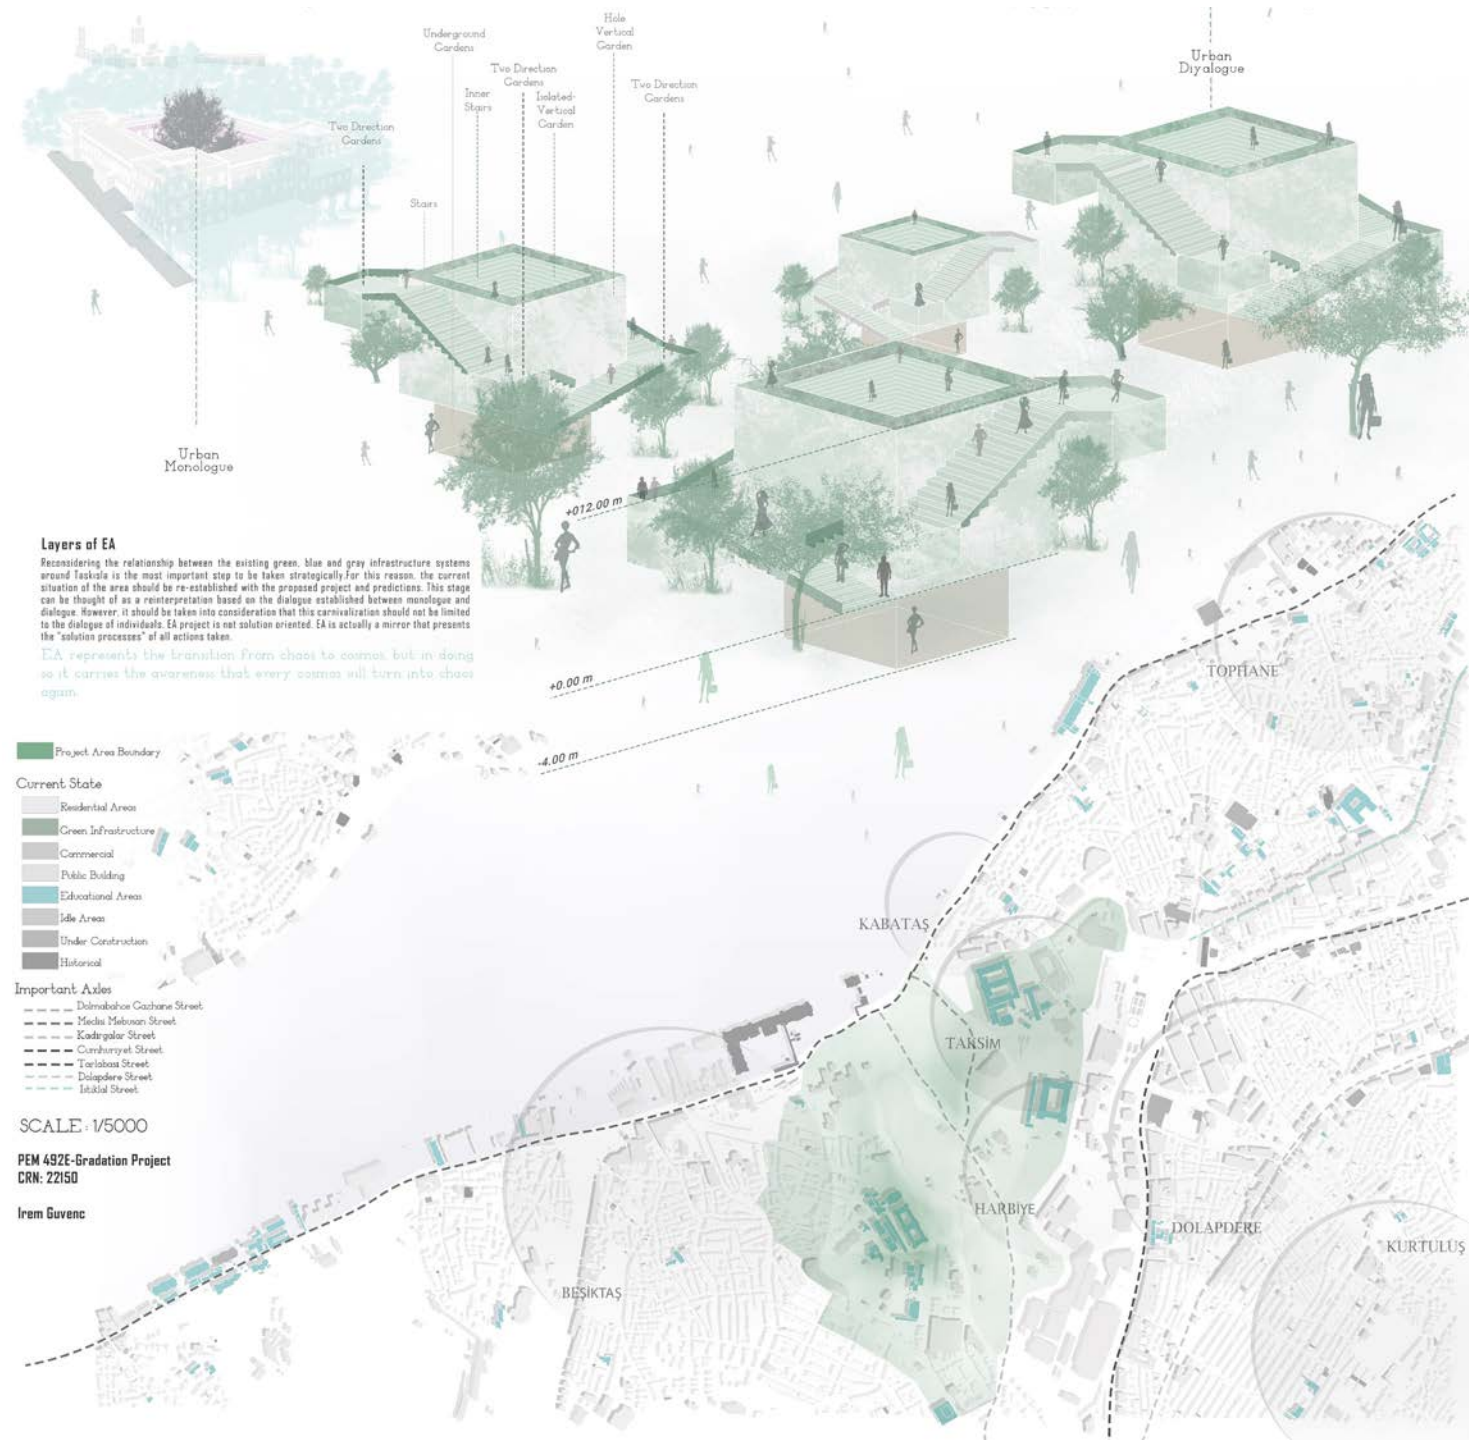

Within the scope of the project, Bakhtin's concept of the Carnavalesque was considered. Using Michael Bakhtin's ideas of carnivalesque and carnivalization, the aim was to provide a new perspective on the city and its relationship with universities.

As is well-known, a carnival is formed when a large number of people from different backgrounds gather at certain times, temporarily stepping away from

the ordinary course of daily life. Looking at this through the lens of the definition of carnival, events involved the looting of homes and businesses owned by Greek-origin residents of Taksim. While this issue is connected to the Cyprus conflict, it is widely known that many of the people who participated in these destructive actions were young university students. The critical question here is: where does this influence on young people stem from? The answer,

of course, is the media. This is where carnivalization plays a key role. Looking back today, painful events are often told with a sense of heroism to the student groups of that time. Being an observer in this situation is also crucial, as observers can more easily notice the absurdities at play. In this context, design strategies were developed, shifting from monologue spaces to dialogue spaces.

However, it should be noted that the relationship between monologue and dialogue is not linear, but rather circular. EA is a cellular design model where different spaces create a dialogue with various boundary elements. EA plants were developed with spaces embedded

within them. These spaces are areas where participants can engage in vertical planting. This concept is a futuristic interpretation of an ancient Far Eastern belief. According to this belief, a person creates a hole in a tree and whispers their secrets into it. Afterward, the gap is filled with soil. Over time, a new

cosmic balance forms here, fostering life. Eventually, it begins to sprout. However, it is important to understand that all cosmos formed in this way inevitably move toward chaos.

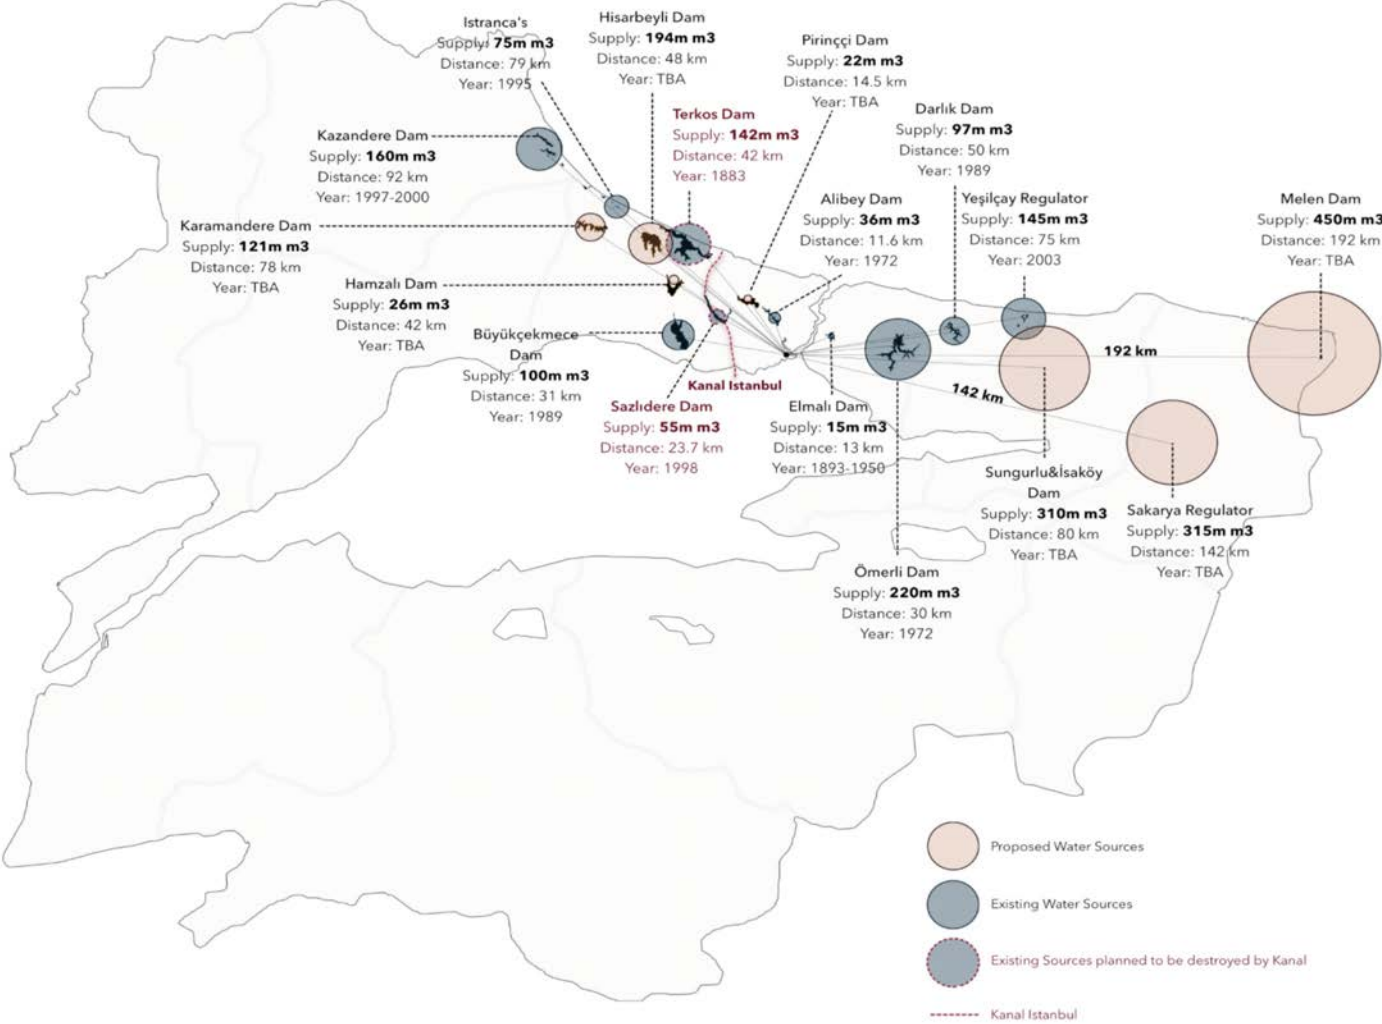

Kırkçeşme Historic Park

Batuhan Ünlü

“Kırkçeşme Historic Park” was produced within the scope of Graduation Project carried out by Assoc. Prof. Dr. Ebru Erbaş Gürler, Assist. Prof. Dr. Melih Bozkurt, Dr. Meliz Akyol Alay, Assoc. Prof. Dr. Zeynep Eres Özdoğan, , Lecturer Dr. Gökçer Okumuş, and Architect Ahmet Aygün and assisted by Res. Assist. Başak Akarsu and Res. Assist. Hüseyin Ögçe under the title “Aqu(A)duct: Re-thinking the Historic Waterway Landscapes of Istanbul” in the fall semester of 2021-2022.

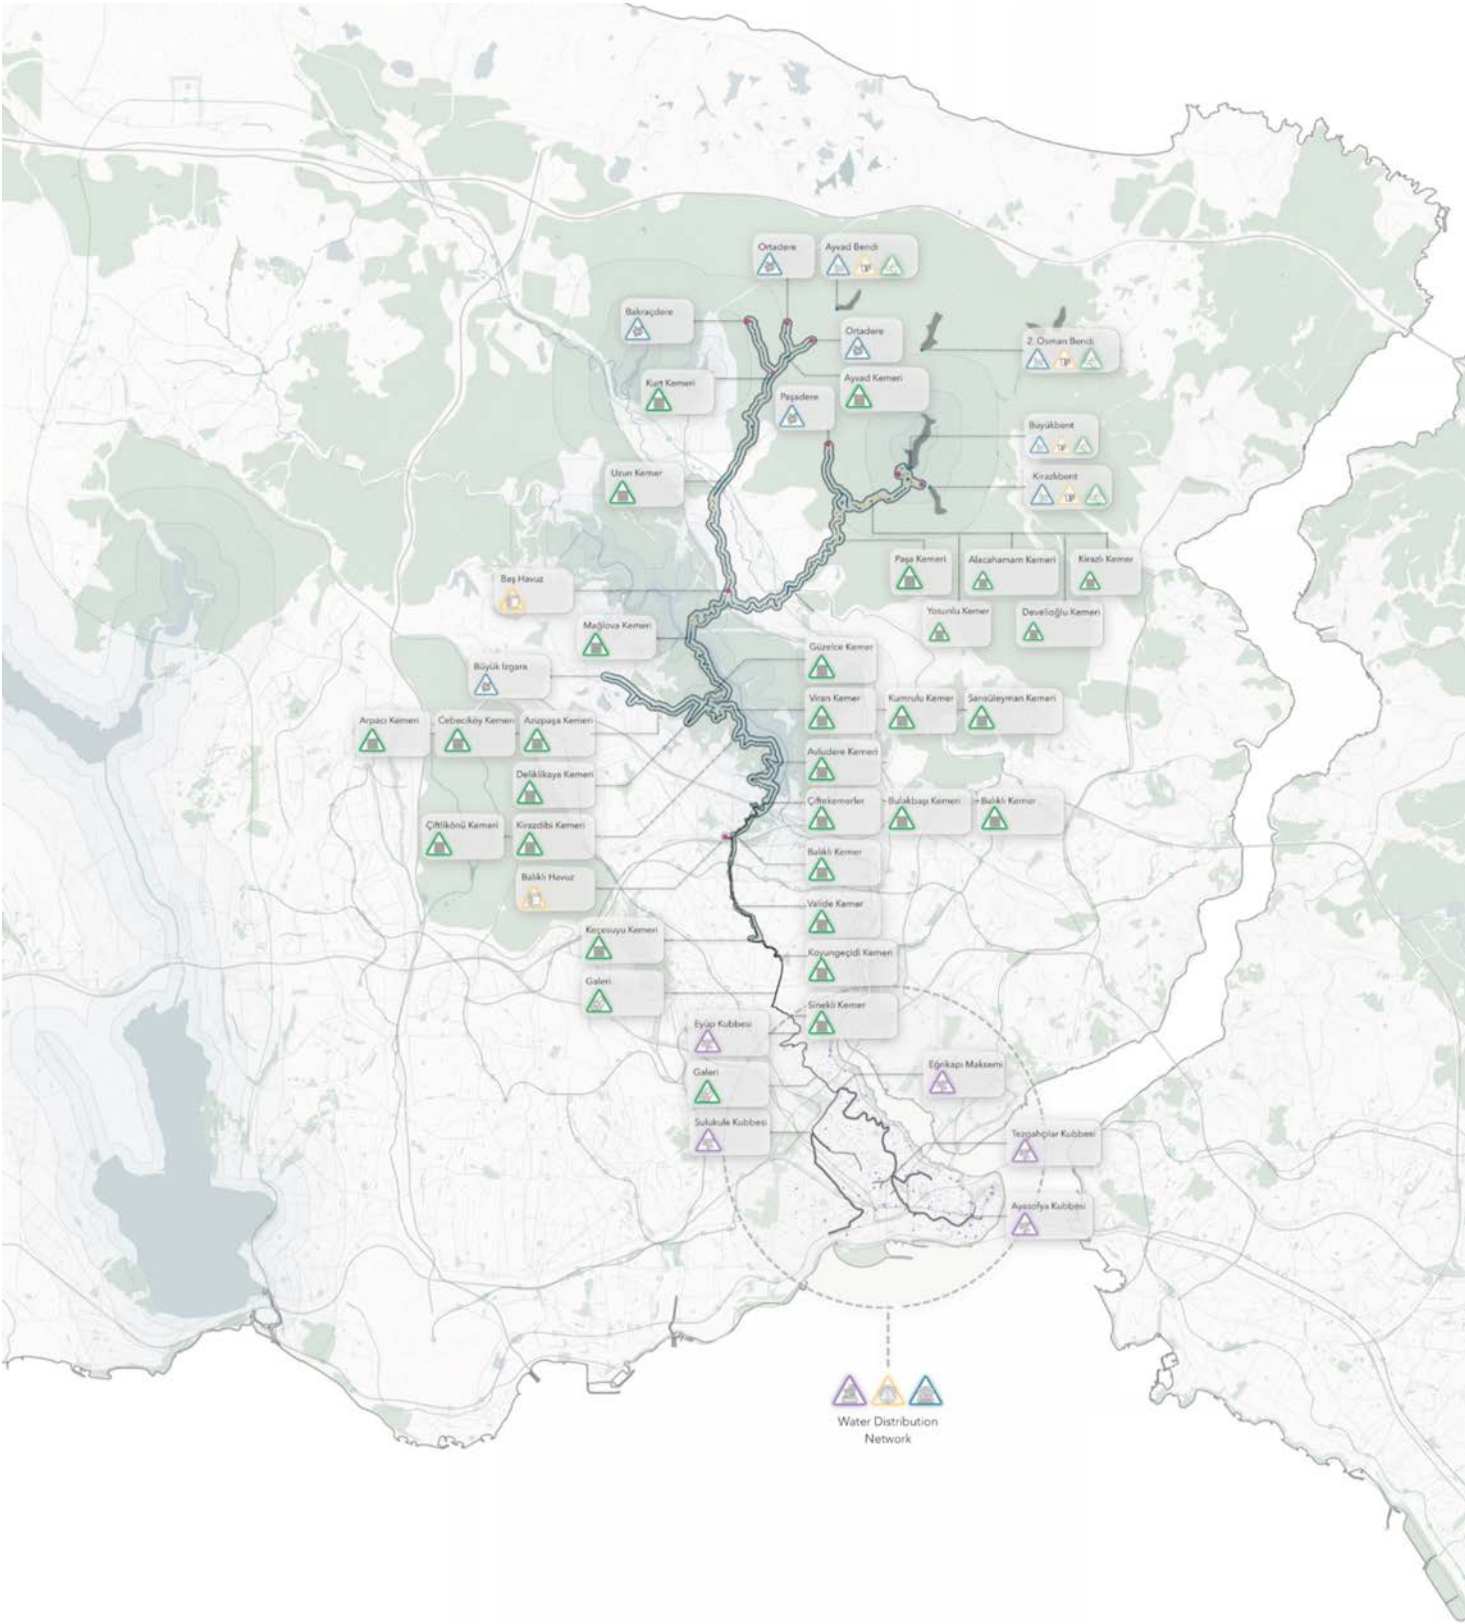

* TMMOB Chamber of Landscape Architects • 10th Landscape Architecture Students Graduation Project Awards, Equivalent Award
* 2022 IFLA Europe Students and Young Professionals Competition Category B - Realised Projects, People’s Choice Award

558

The “Kırkçeşme Historic Park” project aims to analyze, predict, and act on Istanbul's relationship with water, with the goal of creating value for the city and its citizens. To achieve this, the project is structured around three main pillars: Ecological, Urban Memory, and Socio-Cultural. These three goals are represented by three

distinct shapes throughout the project. A historical and spatial analysis of Istanbul's ecological, memorial, and socio-cultural relationship with water has been conducted, followed by future projections. Based on these analyses, respective strategies to achieve the defined goals were outlined. International case studies were examined

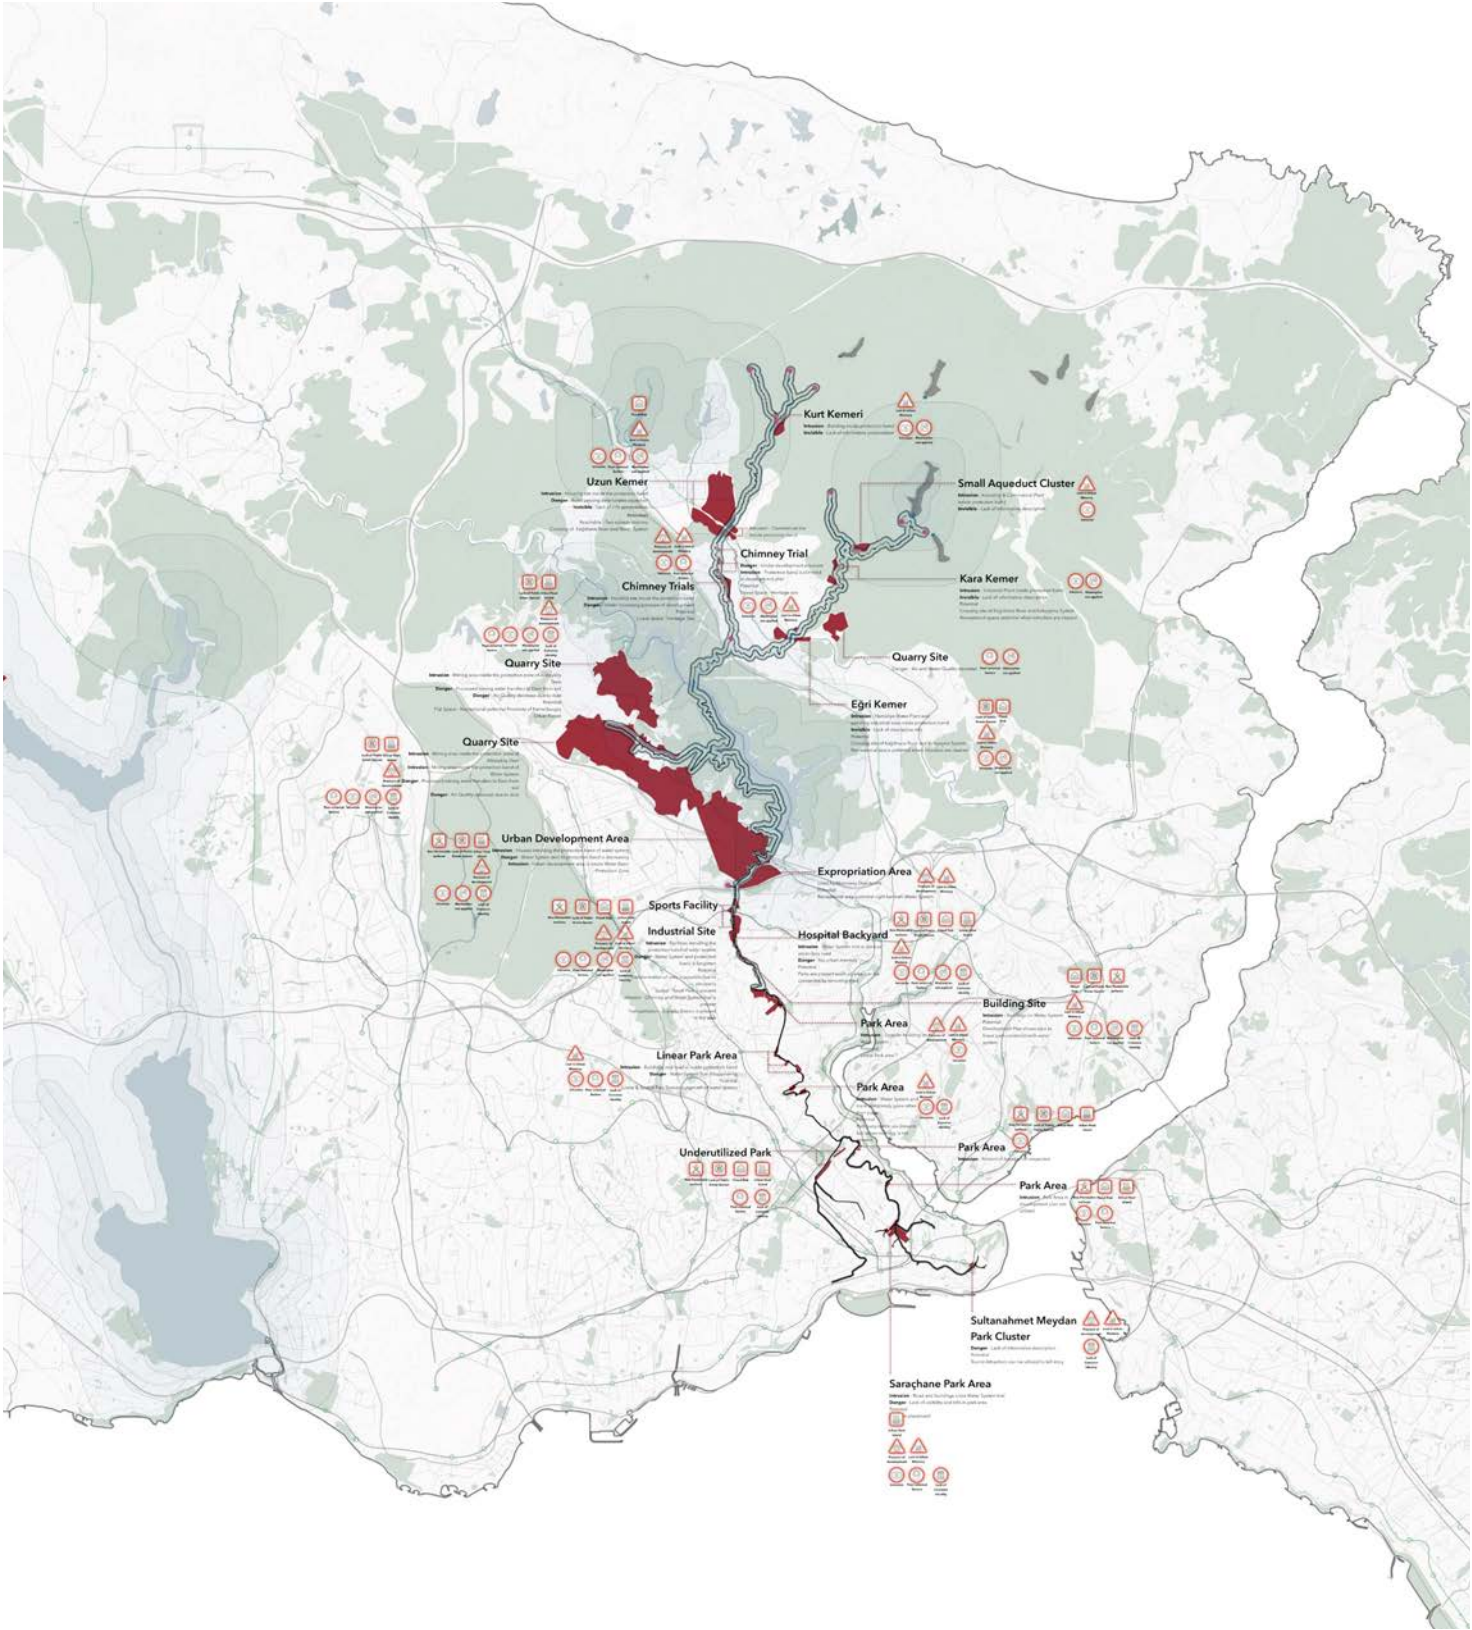

559

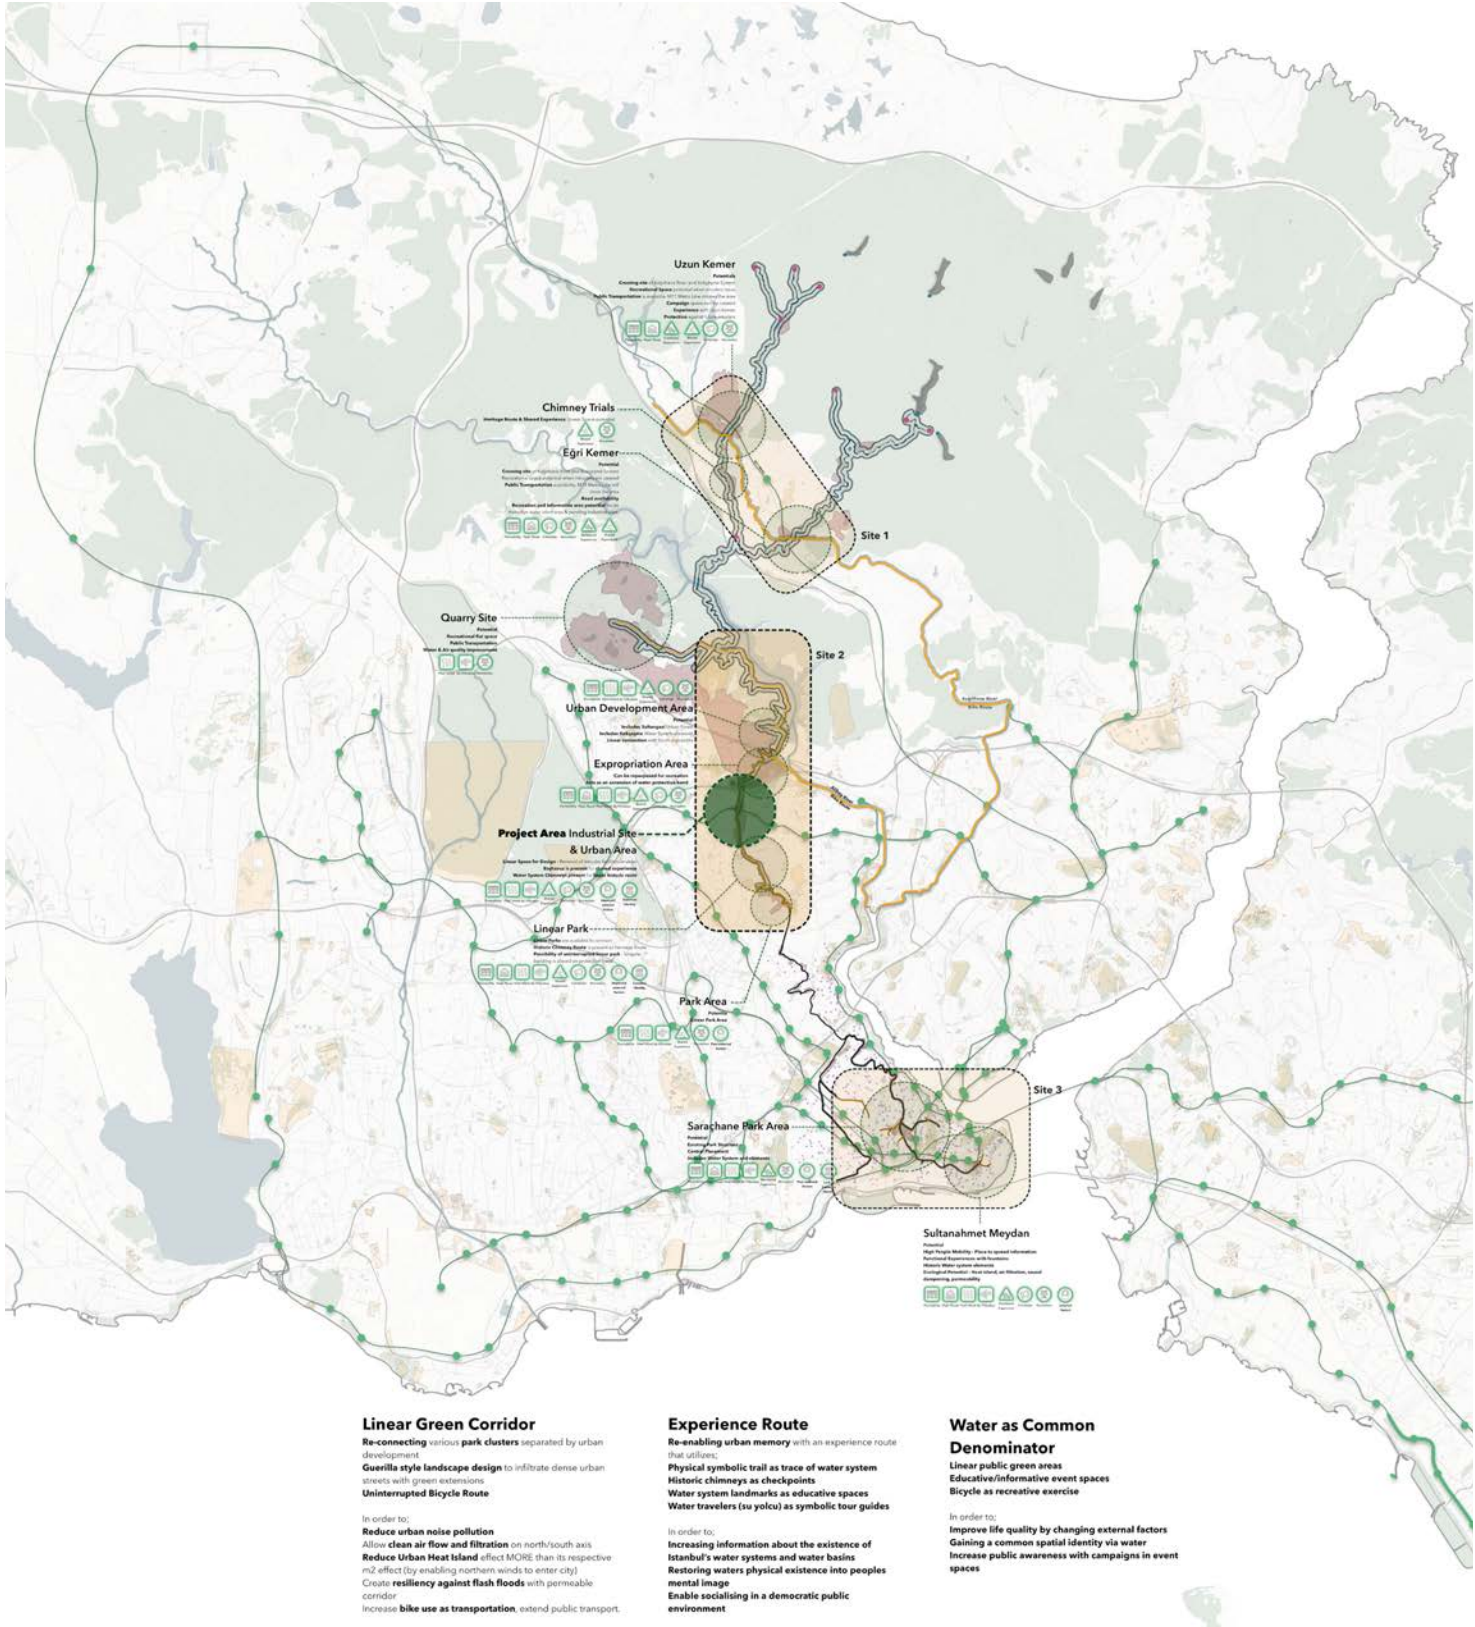

The problems identified in Kırkçeşme have led to spatial potentials that contribute to the three main goals of the project. These potentials are mapped with corresponding shapes and logos, forming a point cloud to highlight the ideal locations for implementing the design strategies that will help us achieve these goals. "Site 1" primarily presents ecological improvement potentials due to its forested rural texture. "Site 3" offers both

ecological and urban memory potentials, making it a valuable area for preservation and development. However, it is "Site 2" that presents the most diverse range of potentials. With its mixed urban, rural, and forest environment, Site 2 holds significant urban memory potential through its linear water system elements, event spaces, and accessibility via public transport, alongside the presence of democratic public parks along its route.

Because of these diverse attributes, "Site 2" will serve as the outer boundary for our spatial design implementation. The Ecological design strategy for this site includes proposing a green corridor that connects park clusters, infiltrating the urban fabric of Site 2 with guerilla landscape design, and introducing a continuous bicycle lane to enhance mobility and ecological connectivity.

Linear Green Corridor
Re-connecting various park clusters separated by urban development
Guerrilla style landscape design to infiltrate dense urban streets with green extensions
Uninterrupted Bicycle Route

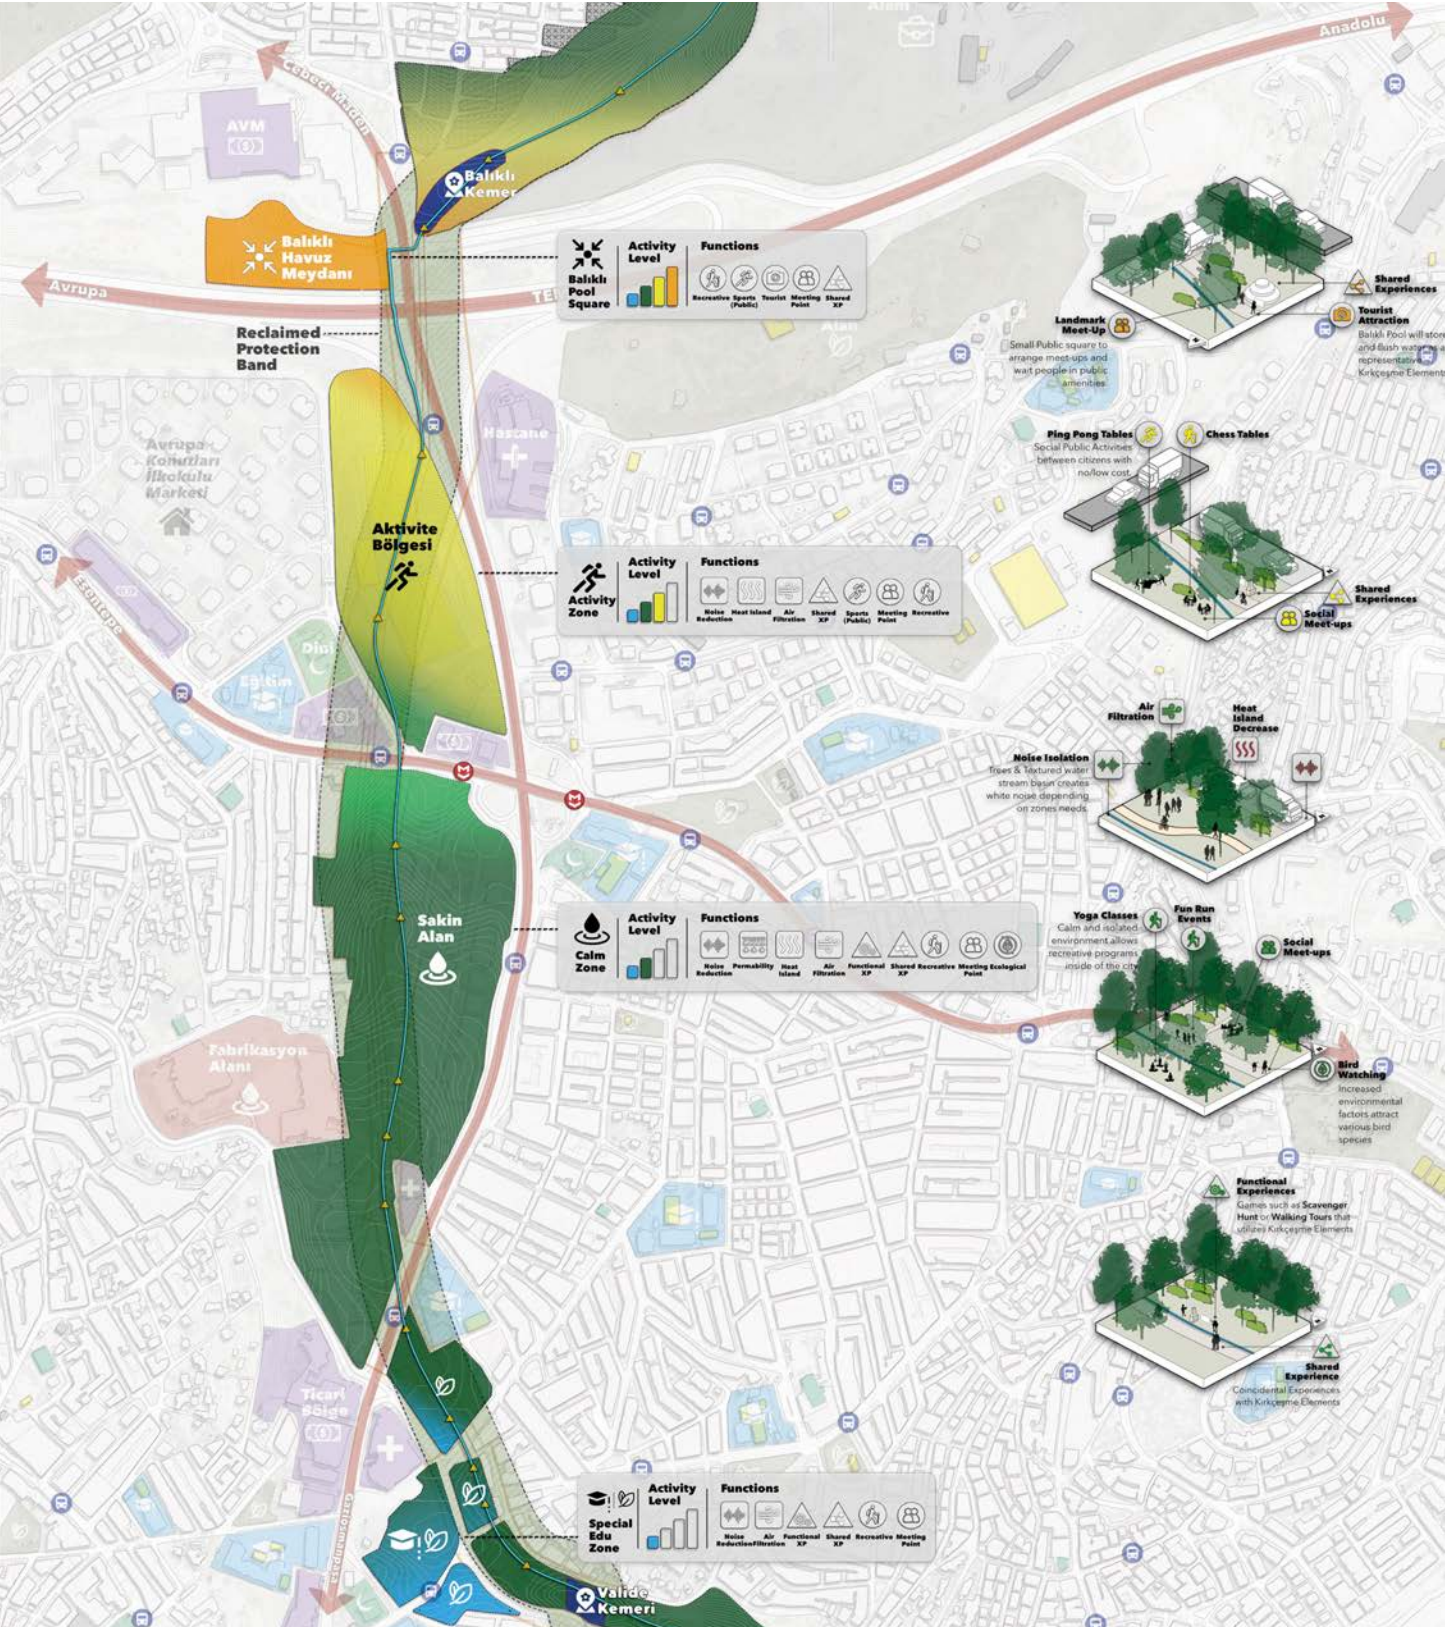

In order to:
Reduce urban noise pollution
Allow clean air flow and filtration on north/south axis
Reduce Urban Heat Island effect MORE than its respective m2 effect (by enabling northern winds to enter city)
Create resiliency against flash floods with permeable corridor
Increase bike use as transportation, extend public transport.

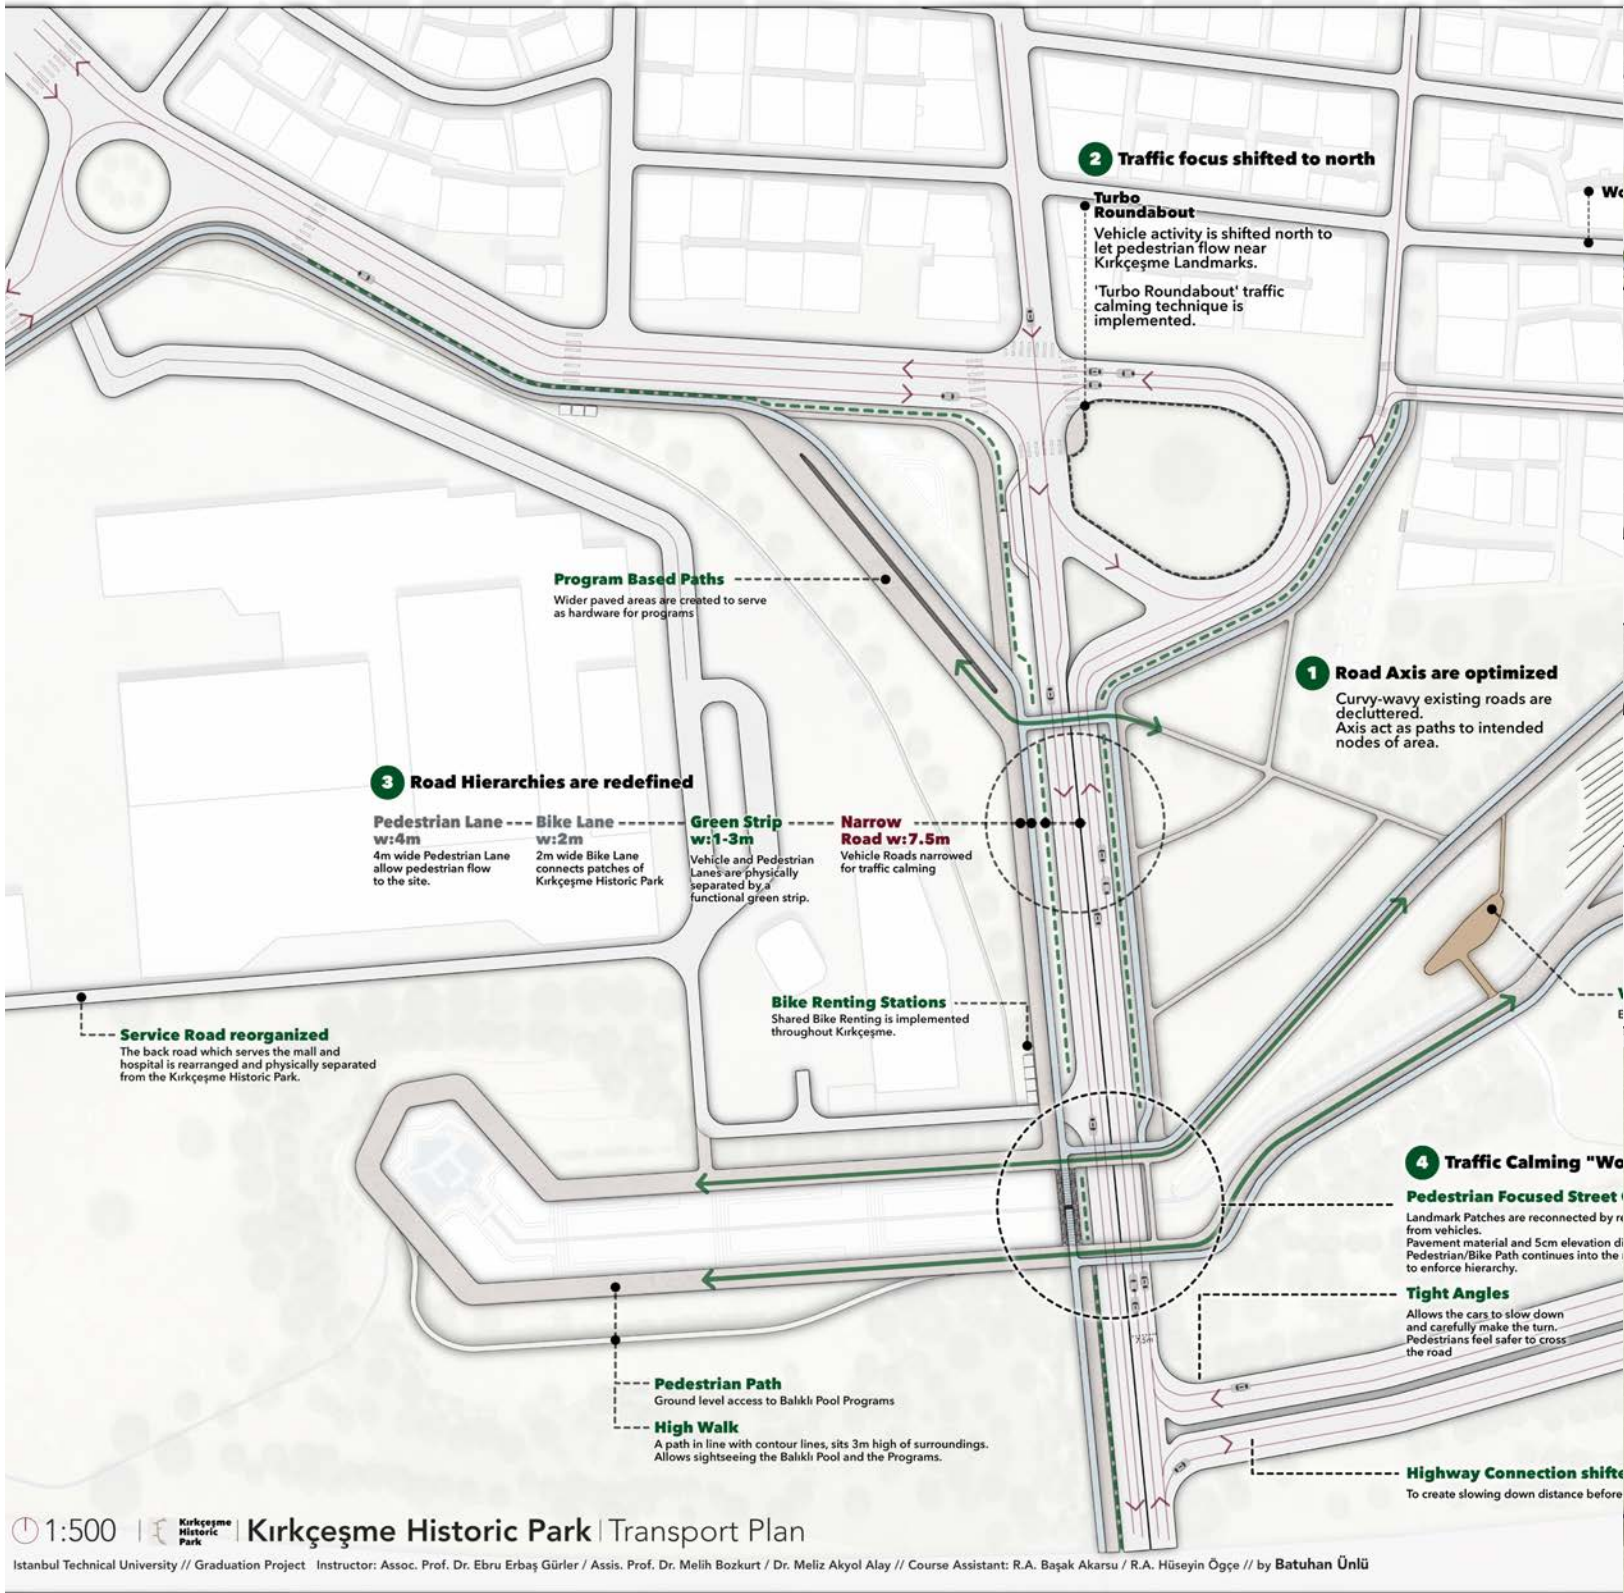

Experience Route
Re-enabling urban memory with an experience route that utilizes:
Physical symbolic trail as trace of water system
Historic chimneys as checkpoints
Water system landmarks as educative spaces
Water travelers (se yollar) as symbolic tour guides

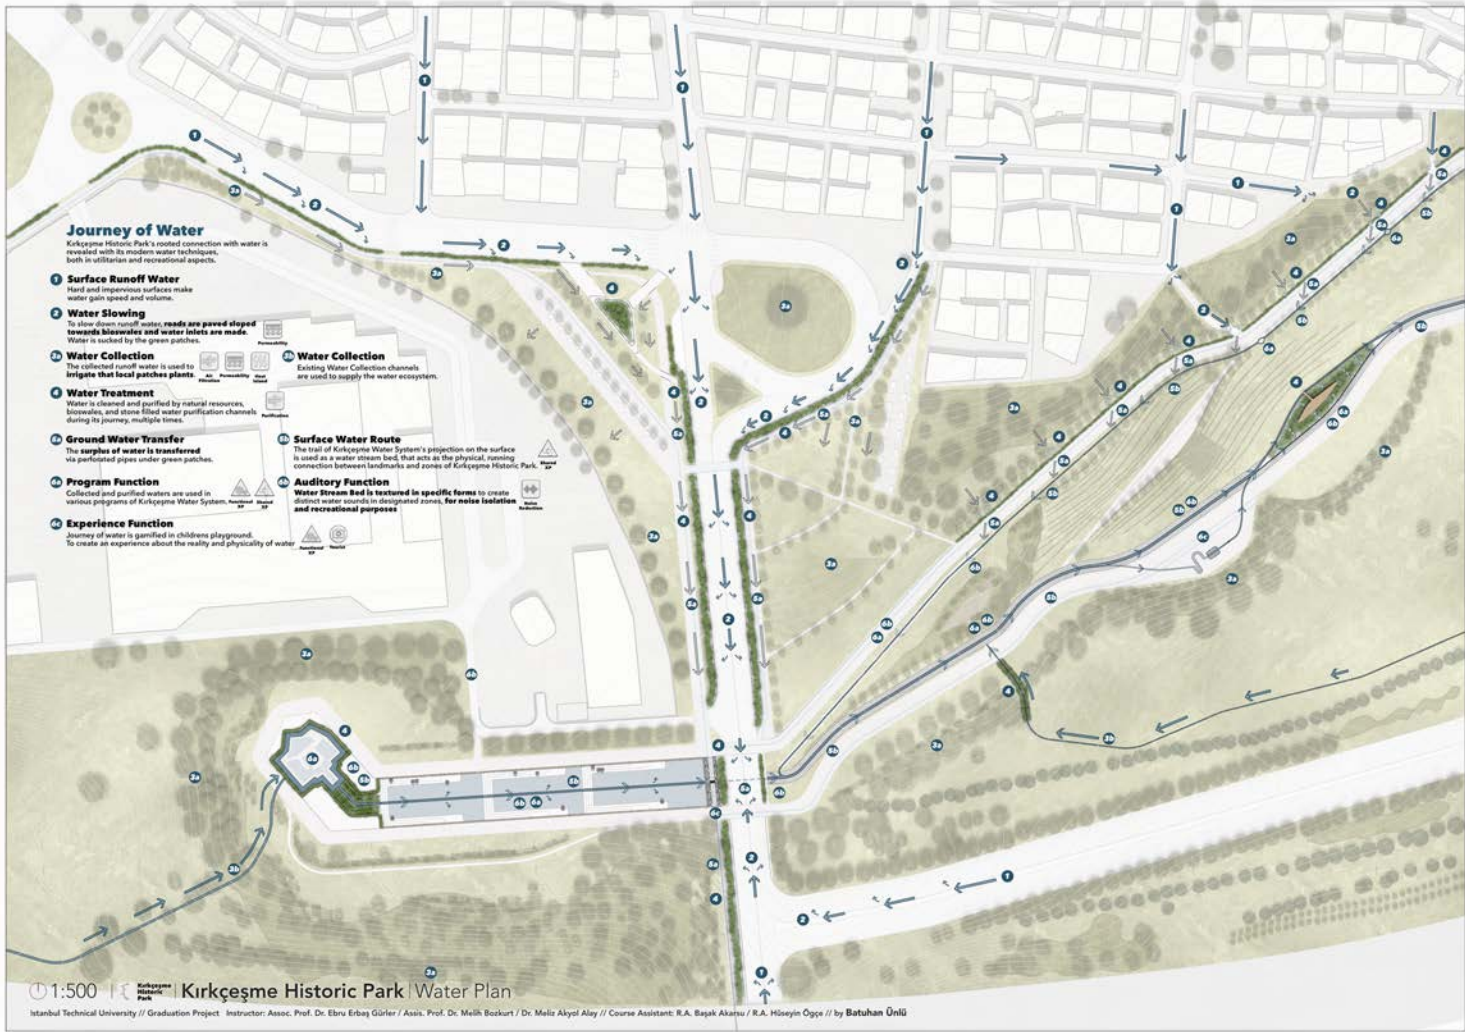

In order to:
Increasing information about the existence of Istanbul's water systems and water basins
Restoring waters physical existence into peoples mental image
Enable socialising in a democratic public environment

Water as Common Denominator
Linear public green areas
Gaining a common spatial identity via water
Increase public awareness with campaigns in event spaces

In order to:
Improve life quality by changing external factors
Gaining a common spatial identity via water
Increase public awareness with campaigns in event spaces

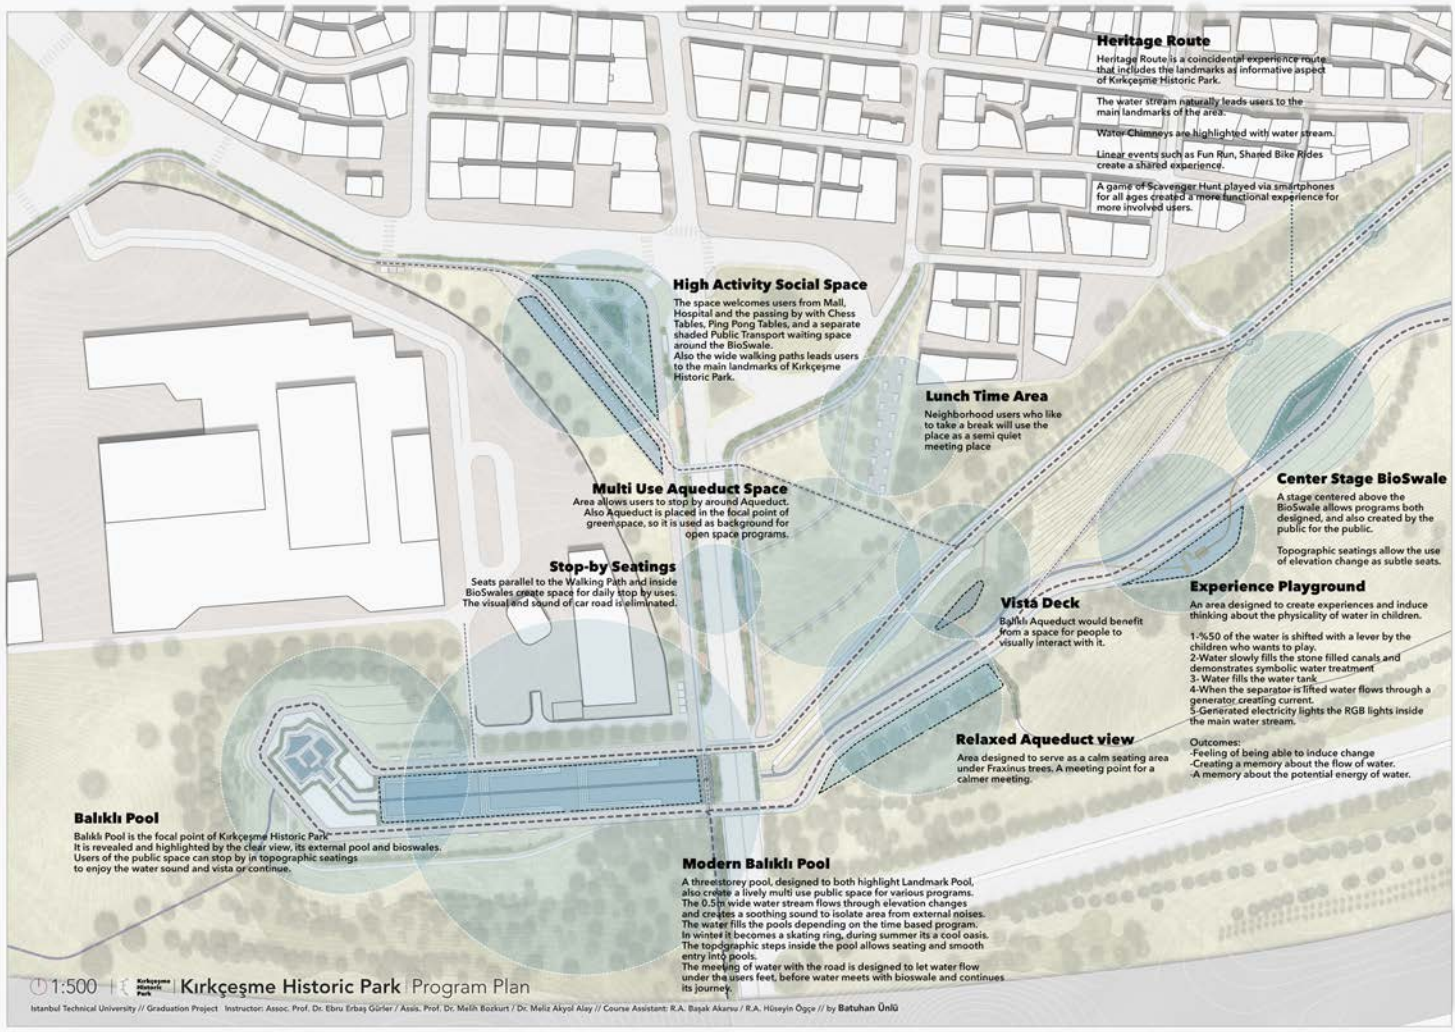

The ecological strategies for Kırkçeşme Historic Park are implemented by revealing the Balıklı Zone and transforming the old tertiary road leading to Kırkçeşme Valley into a “Calm Zone.” This area will be isolated from the urban fabric using visual and auditory barriers, with vegetation and water sounds enhancing the tranquil environment. The Balıklı Pool, which serves as the focal point of human flow, will be revitalized to harness its full potential. The Urban Memory design strategy focuses on creating a “shared & functional experience”

for visitors. This experience includes a physical, symbolic trail of the water system, checkpoints marking historic chimneys, educational event spaces at landmark locations, and guides who are the historical “su yolcusu” (water travelers) of Kırkçeşme. These strategies aim to contribute to a park identity that will be embedded in the public urban memory. The Urban Memory goal will be implemented throughout the park with inclusive and engaging experiences. Functional experiences involve programs related to Kırkçeşme, while shared

experiences are more incidental and invite interaction among locals and visitors alike.

The park will use the image of water as a unifying force, a metaphorical glue for the fragmented mosaic of Istanbul. Ultimately, Kırkçeşme Historic Park will serve as a democratic urban green space where every citizen can enjoy the park and find a connection to the city’s history and natural environment.

The Balıklı Pool, as the main focal point of the park, will feature a three-story public space that serves a variety of programs throughout the day, week, and year, offering activities for the public. The landmark Balıklı Pool will be highlighted by cleaning up intruders and creating a protected, separate path to preserve its historical significance. Similarly, the Balıklı Aqeduct will be revealed through urban transformation techniques and safeguarded from external threats by ensuring it is owned and cared for by the public.

Kırkçeşme Valley will be divided into two sections: the upper Heritage Route and the lower Calm Route. These routes will feature flowing water, with one route representing the real Kırkçeşme Galleries and the other serving as a symbolic water route. The flowing water will lead people naturally through the park, guiding them to different program zones. This continuous flow of water will help define the park’s identity, creating a seamless, connected space.

The programs offered in the park are designed to serve all types of users, from

children to the elderly. The playgrounds will offer thought-provoking experiences that will leave lasting memories for children, while elderly visitors can find tranquility and peace near the Balıklı Pool. Office workers will have the opportunity to take a break and enjoy the park during their lunch hour. The human flow from nearby locations such as the Mall and Hospital will also contribute to the vibrancy of the square area, bringing more visitors to the park. This ensures that the park remains a lively and accessible public space for everyone.
